# $^{127}\text{Xe}$

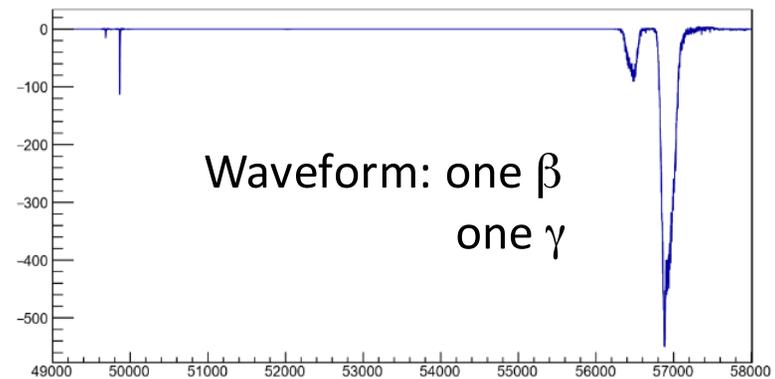

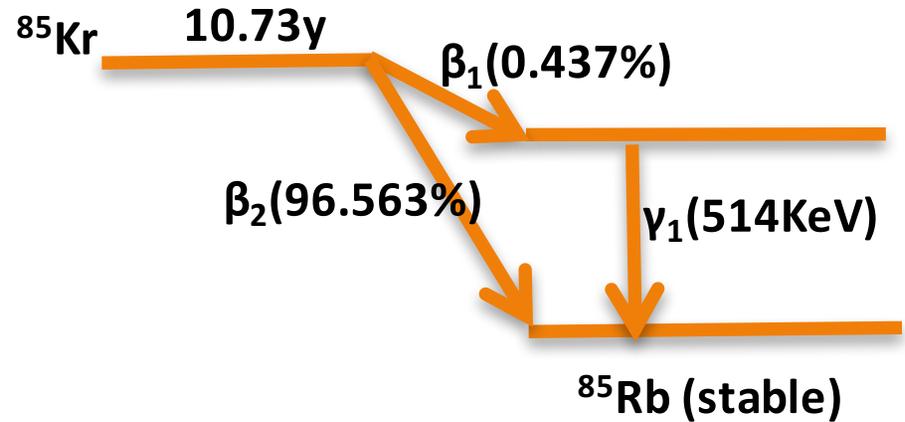

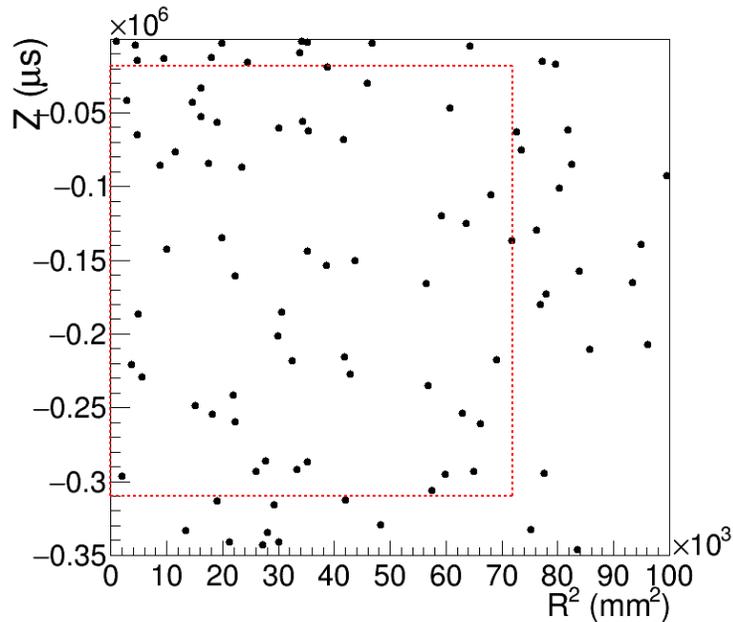

Average  $^{127}\text{Xe}$  rate in the low energy DM search region ( $<10$  keV) estimated to be  **$0.42 \pm 0.10$  mDRU** (DRU = evt/kg/keV/day)

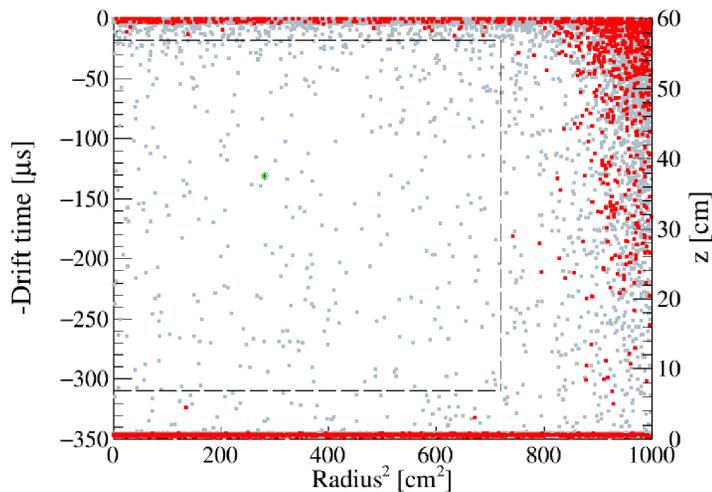

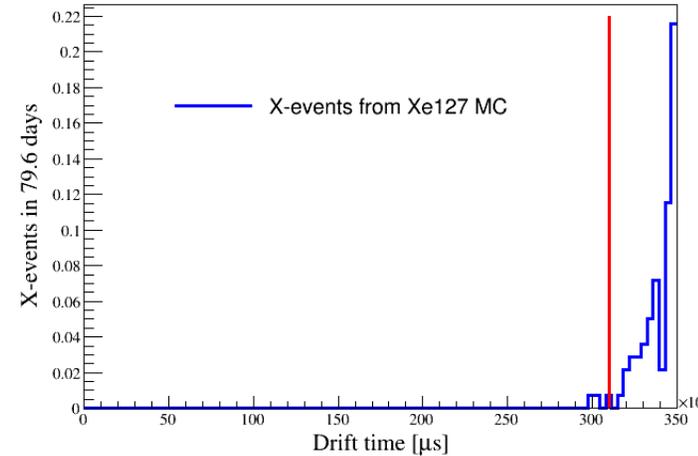

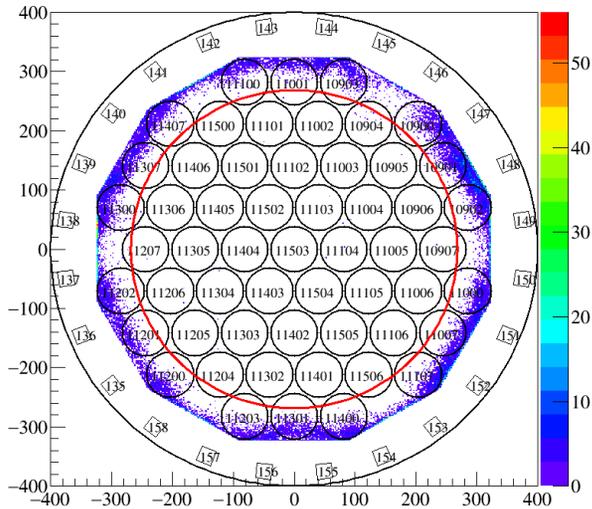

# 85Kr

- Identified by delayed  $\beta$ - $\gamma$  coincidence analysis
- Uniform** distribution
- Significantly reduced after distillation

# Final selection cuts

## 几何选取 (FV in Run 9 with 328.9 kg)

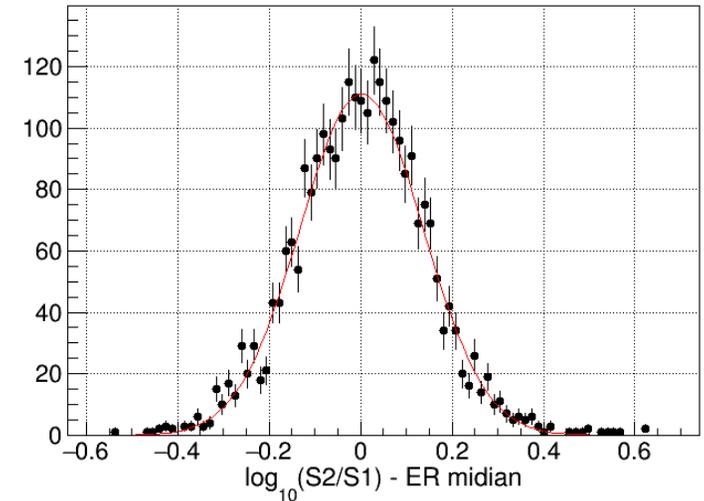

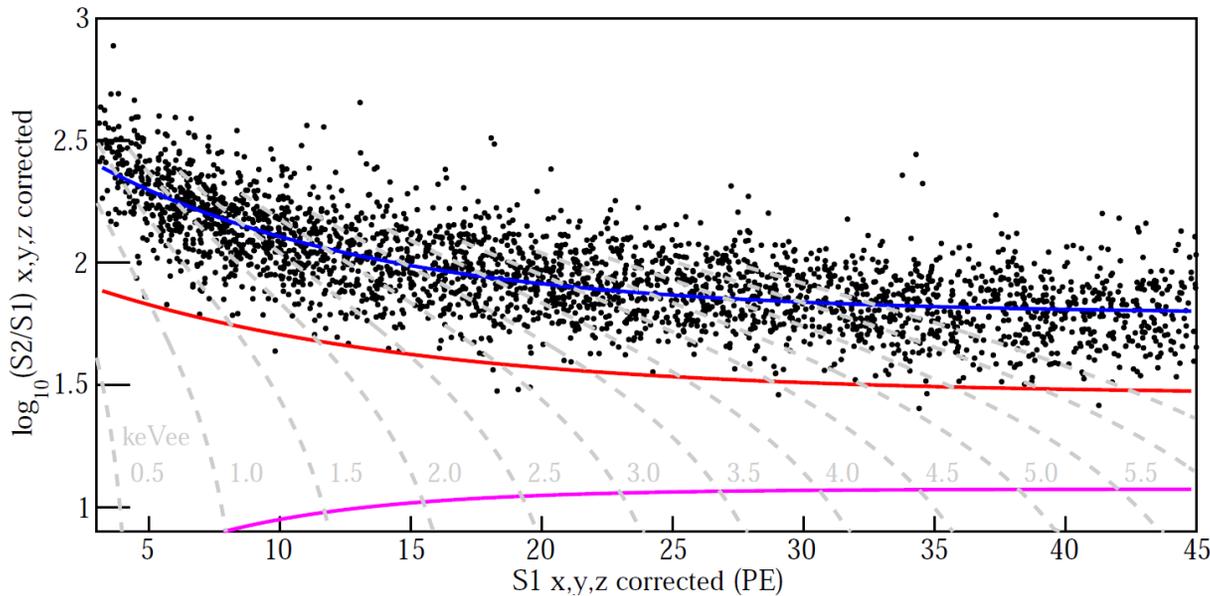

- Horizontal cut determined by distribution of events with S1 between [45,200] PE and suppressed S2
- Vertical cut: Upper boundary consistent with the previous analysis; Lower boundary determined by X-events from  $^{127}\text{Xe}$  MC

## 噪声选取

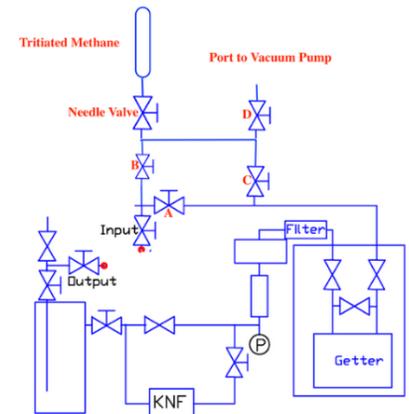

- S1 cut:[3,45] PE
- S2 cut[100raw, 10000]PE

# ER cal. w/ $\text{CH}_3\text{T}$ $\beta$ source

- 18.0 hours of tritium data taken, with  $\sim 2800$  low energy ER events collected
- 9 events leaked below NR median,  $(0.32 \pm 0.11)\%$
- Consistent with Gaussian expectation

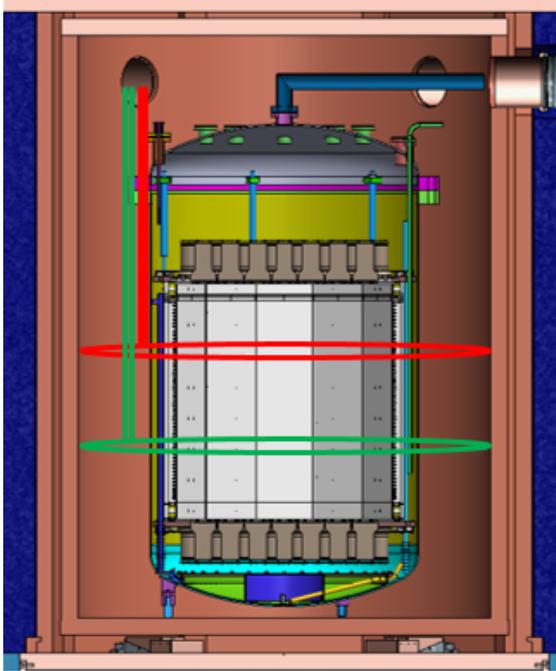

# Radation Background

---

- ER background
  - $^{127}\text{Xe}$  (due to surface exposure of xenon during distillation)
  - $^{85}\text{Kr}$  (suppressed by a factor 10)
