

Heavy ion physics overview

—focus on ALICE-China topics

Yaxian Mao

Central China Normal University

Heavy ions at the LHC

- Investigate the region of the phase diagram of strongly interacting matter corresponding to the highest possible temperature and the lowest net baryon density

- Recreate the first (and hottest!) liquid that ever existed and that gave rise to matter around us ...

... and study its properties in the laboratory

The energy frontier

- Evolution of (some) properties of the system with the collision energy (N. B. approximate values!)

| Central collisions | SPS | RHIC | LHC |
|--|---------|------|--------------|
| \sqrt{s} (GeV) | 17 | 200 | 5000 (today) |
| $dN_{ch}/d\eta$ ($\eta = 0$) | 450 | 650 | 2000 |
| Energy density (GeV/fm ³) | 2.2-3.2 | 5.4 | 20 |
| V (fm ³) - from HBT | 120 | 160 | 300 |
| Decoupling time (fm/c) - from HBT | 6 | 7.5 | 10.5 |
| Average QGP temperature (MeV) - photons, dileptons | | | |

LHC → hotter, larger, and longer lived fireball!

The collision systems

Pb-Pb collisions

Hot matter effects

Soft + hard probes

p-Pb collisions

Calibrate cold nuclear matter effects (CNM)

pp collisions

Reference for Pb-Pb collisions, QCD

Change of paradigm at LHC energies

High multiplicity p-Pb and pp collisions show intriguing signal of QGP-like effects

Collision centrality

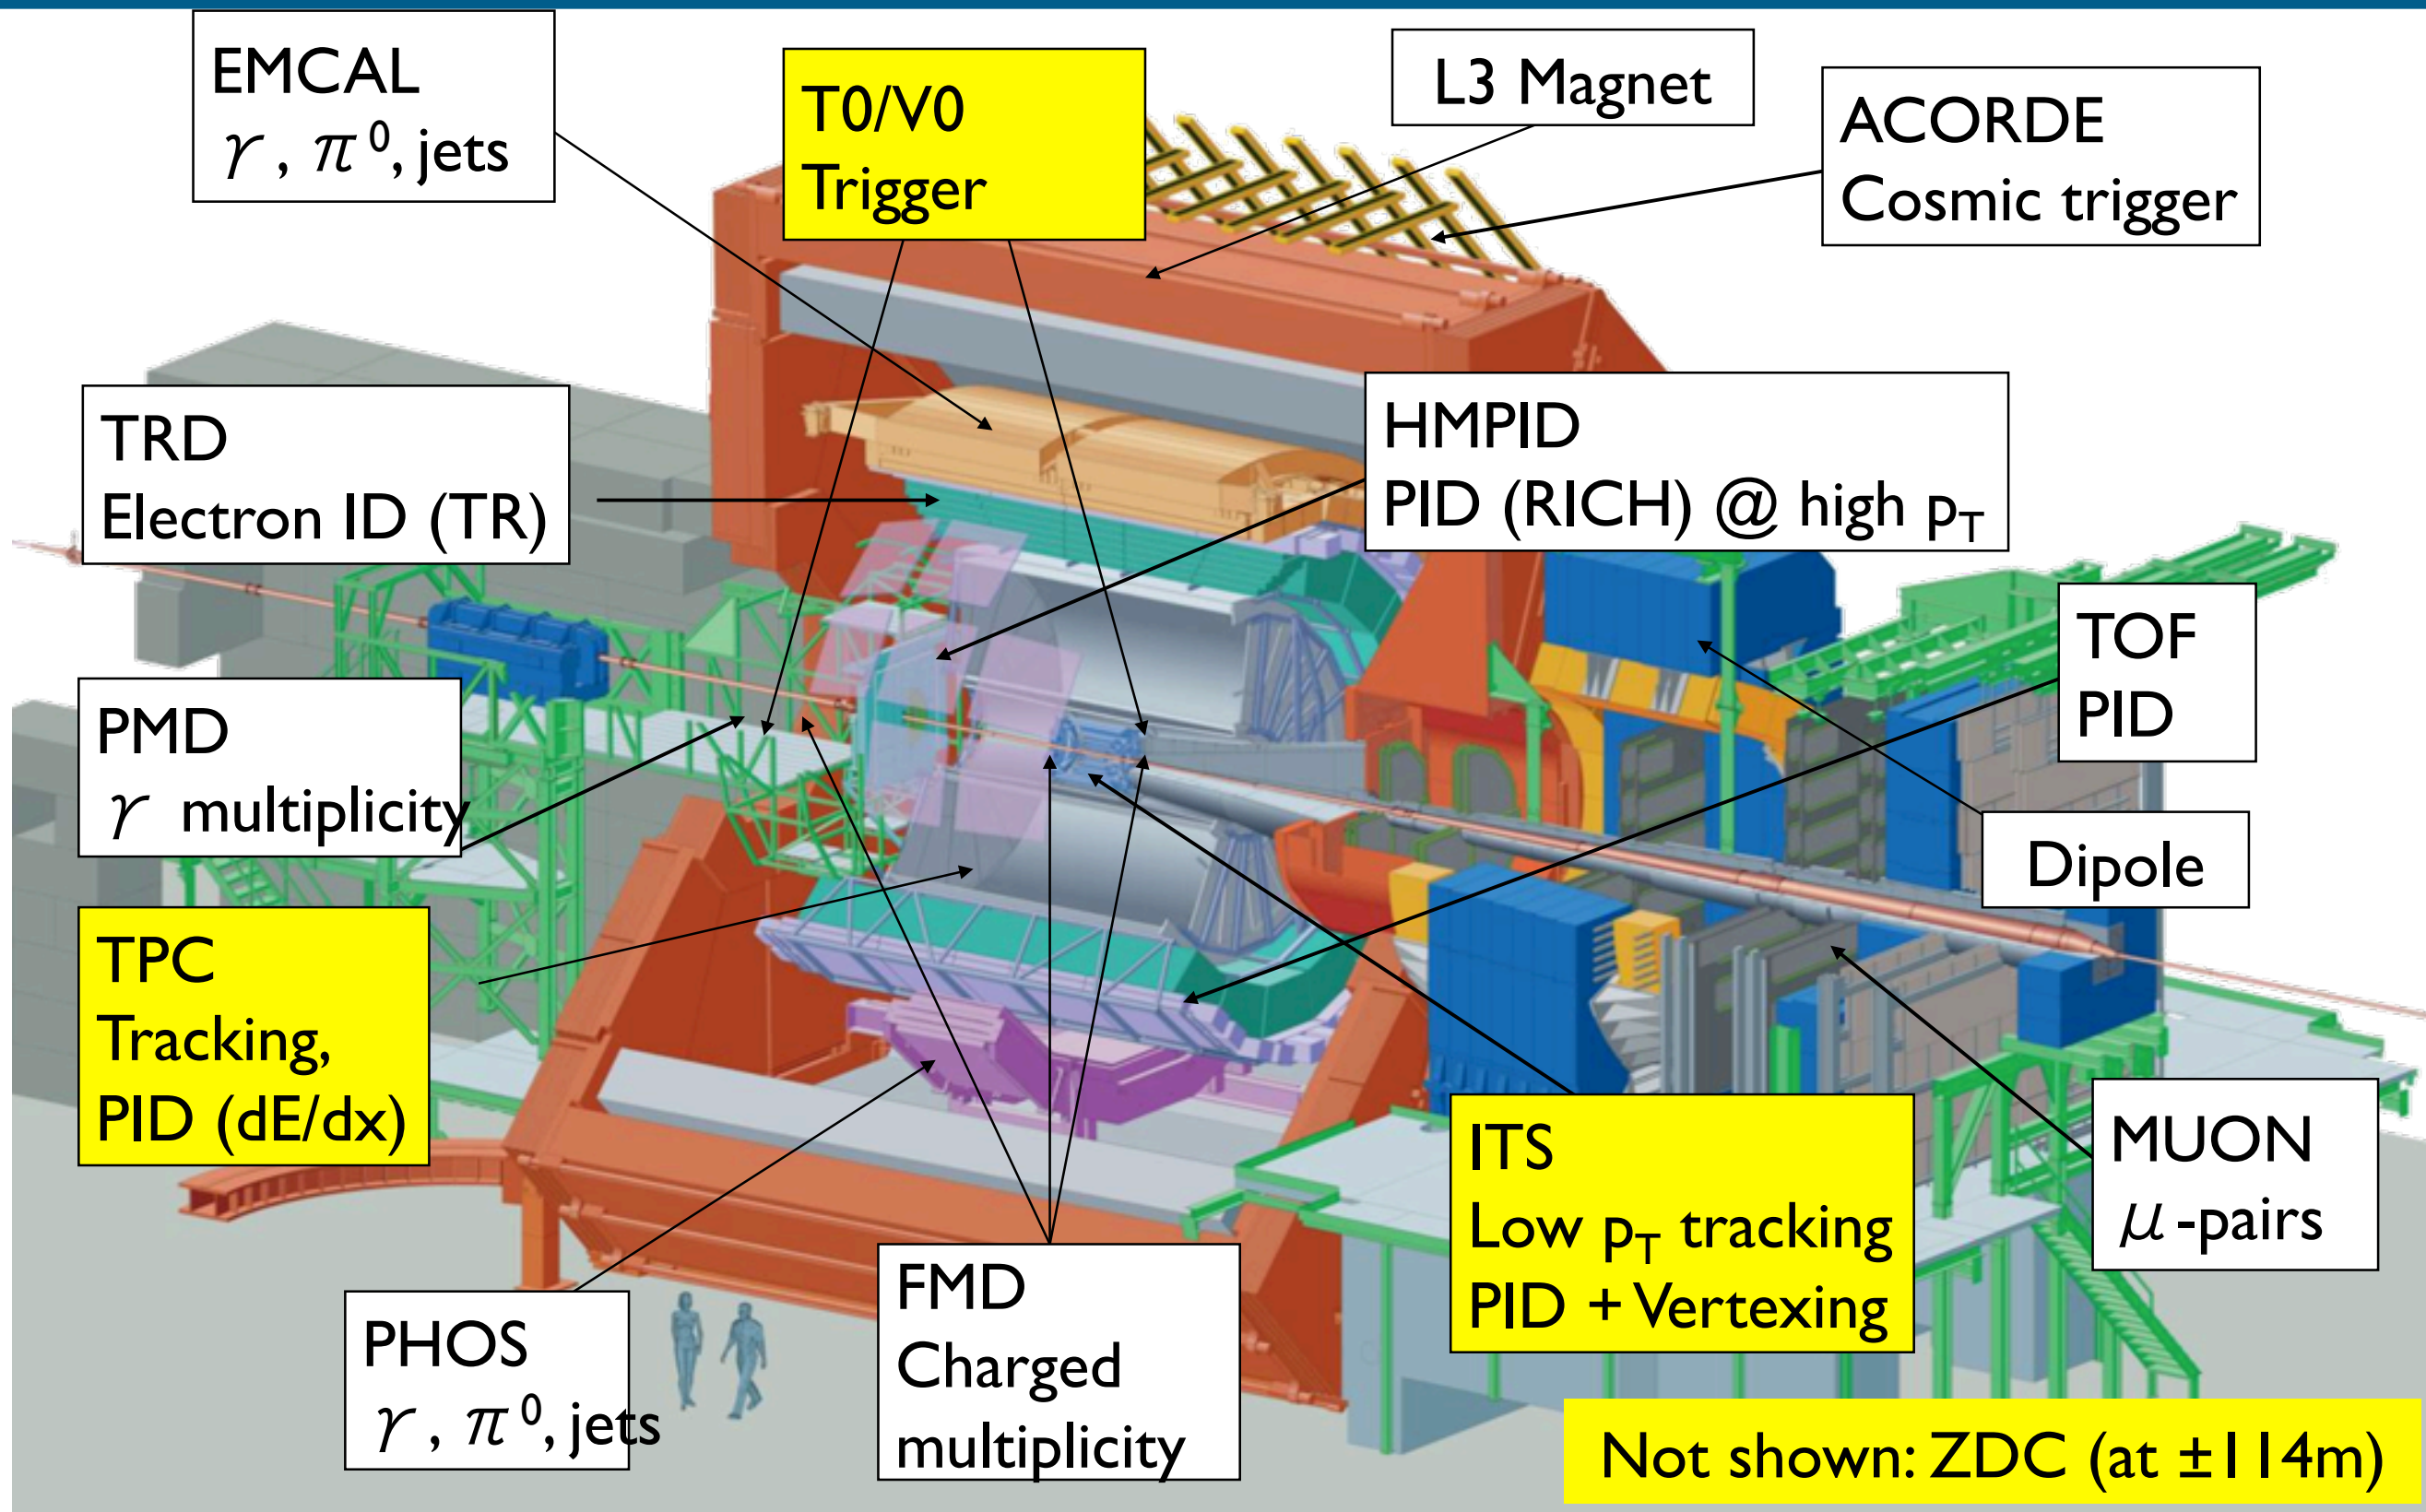

- Nuclei are extended objects
- Geometry related to observables via Glauber Model
- Related to multiplicity or forward energy (spectators)

Soft processes: long timescale, large σ , $\sigma_{\text{tot}} \propto N_{\text{part}}$
 Hard processes: short timescale, large σ , $\sigma_{\text{tot}} \propto N_{\text{coll}}$

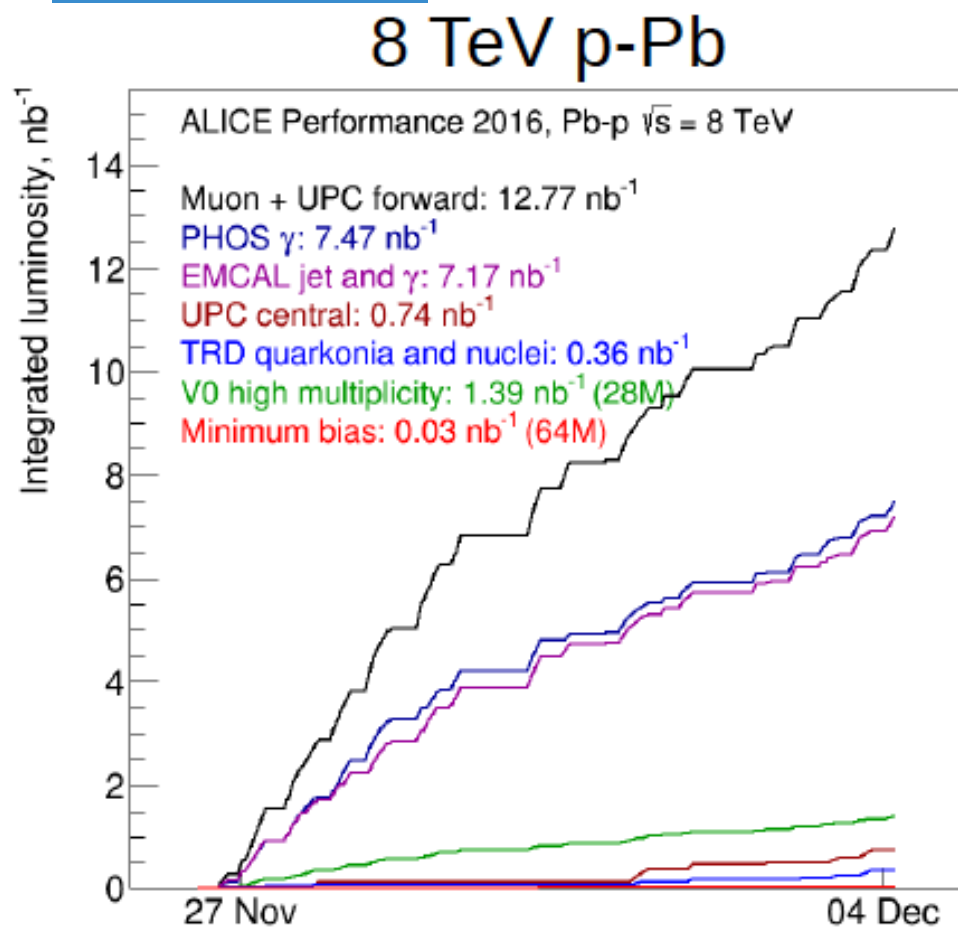

ALICE: A Large Ion Collider Experiment

- General-purpose detector for the study of QGP-related signals at the LHC, with several unique features

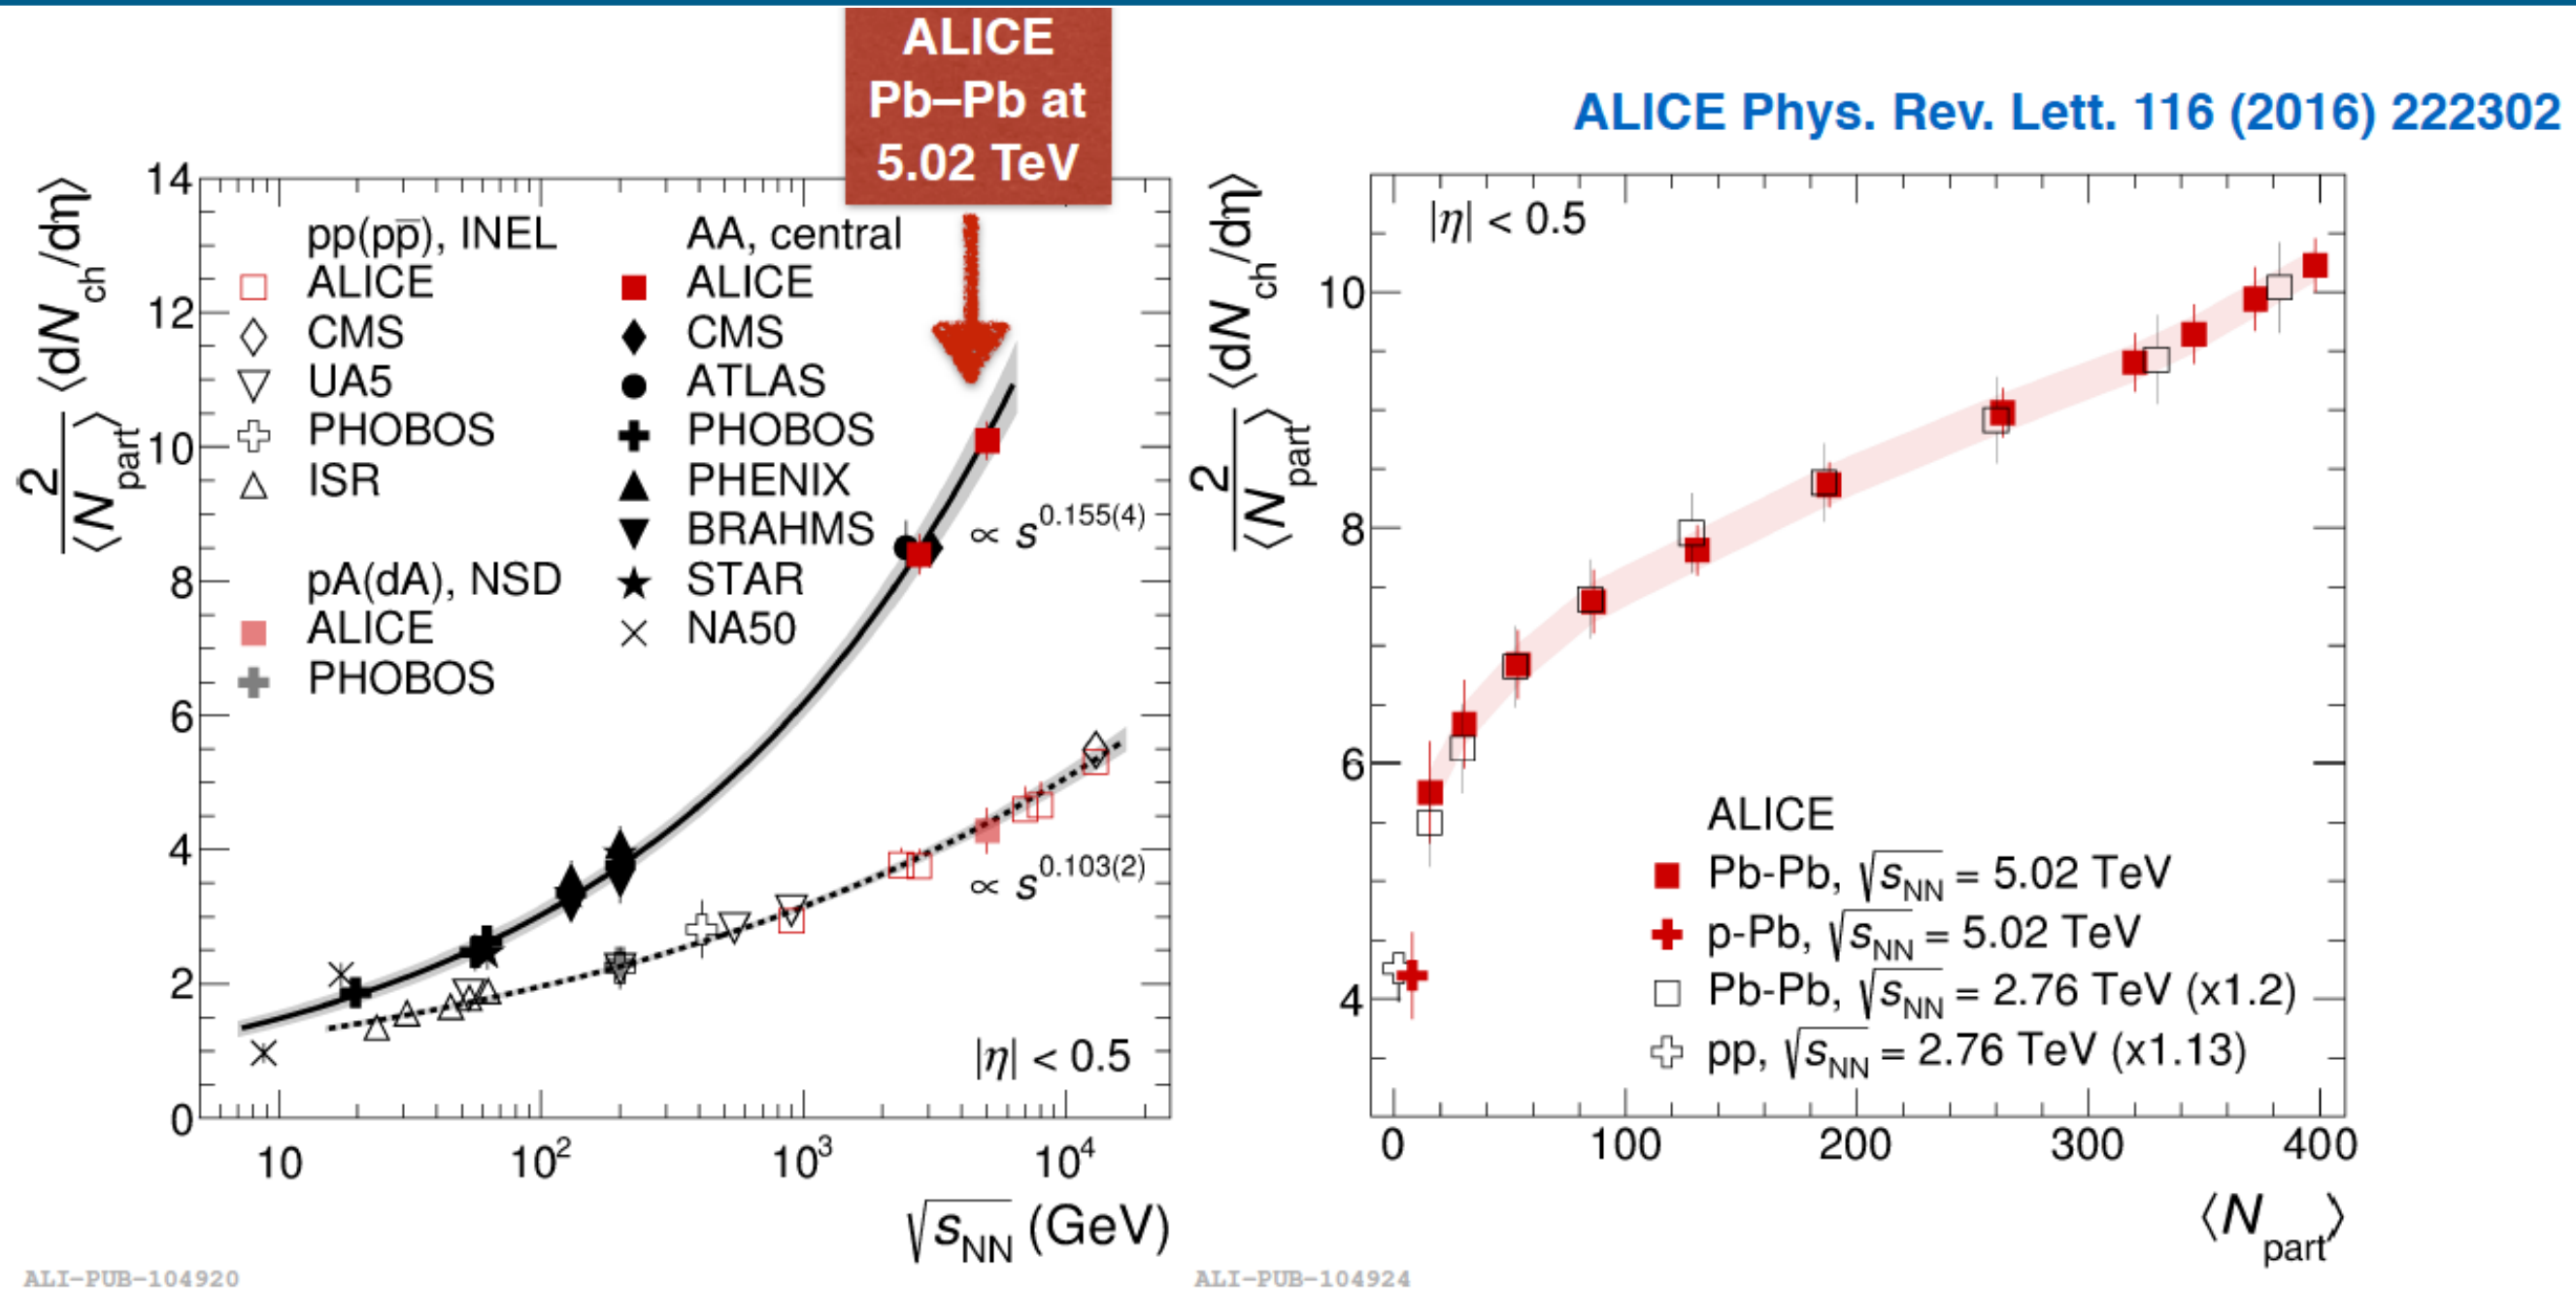

ALICE Run2 data samples

| System | $\sqrt{s_{NN}}$ (TeV) | L_{int} | Year |
|--------|-----------------------|----------------------|-----------|
| pp | 13 | 14 pb ⁻¹ | 2015-2016 |
| Pb-Pb | 5.02 | 0.4 nb ⁻¹ | 2015 |
| pp | 5.02 | 100 nb ⁻¹ | 2015 |
| p-Pb | 5.02 | 3 nb ⁻¹ | 2016 |
| p-Pb | 8.16 | ~20 nb ⁻¹ | 2016 |

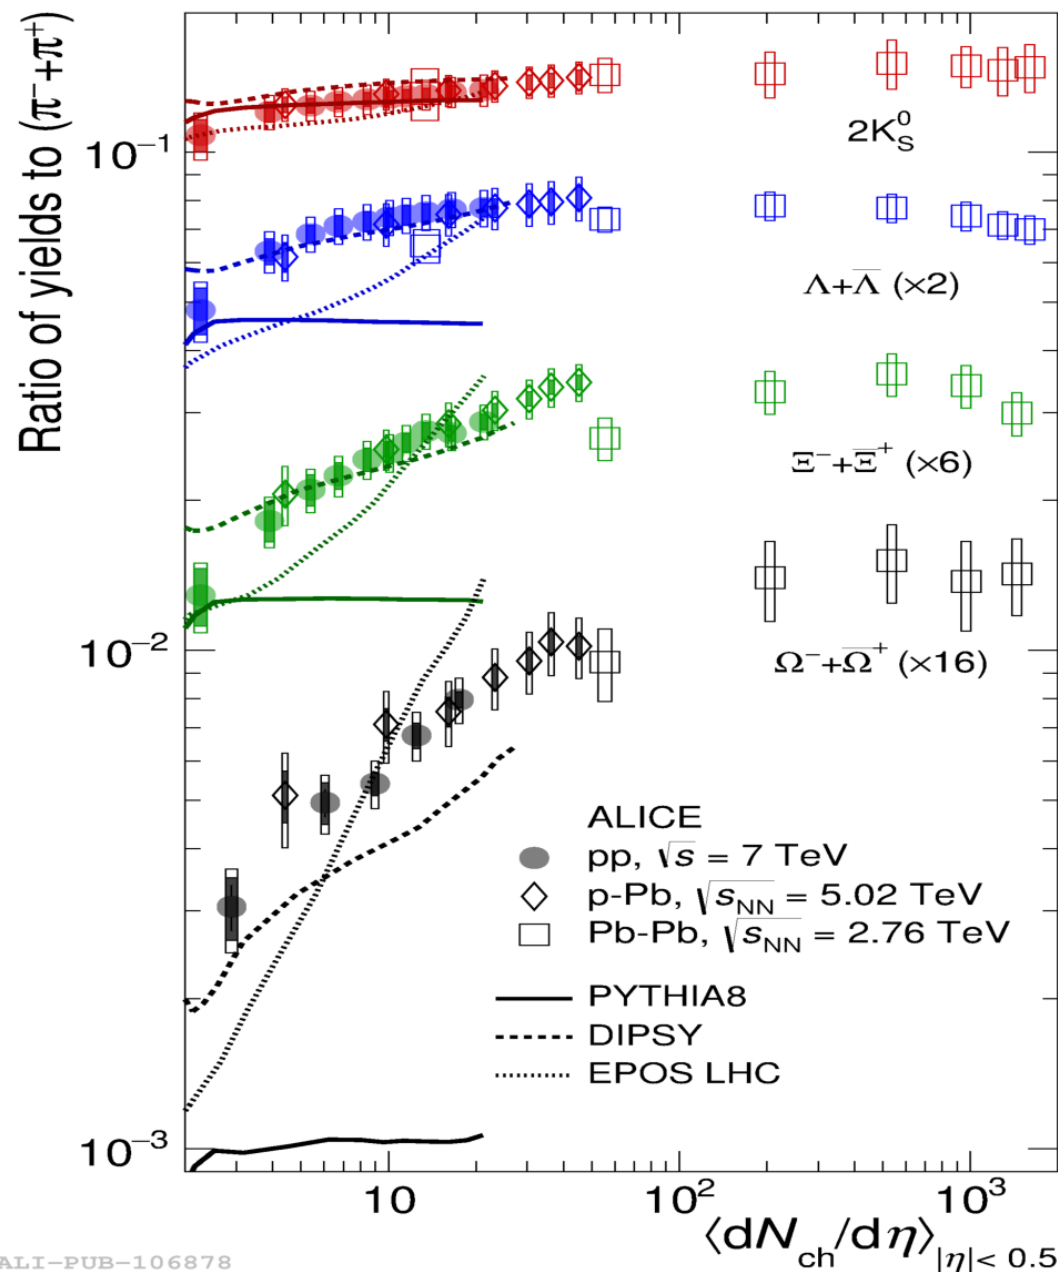

- Versatile and challenging trigger mix
- Extremely stable operations
 - Thanks to CERN accelerator teams
 - ALICE efficiency > 90%

Charged particle multiplicity

- ALICE: Pb-Pb at 5.02 TeV, highest energy reached so far → confirms trend from lower energies
- Similar evolution with centrality between 5.02 and 2.76 TeV
- Provides further constraints for model

Multiplicity dependent strangeness production

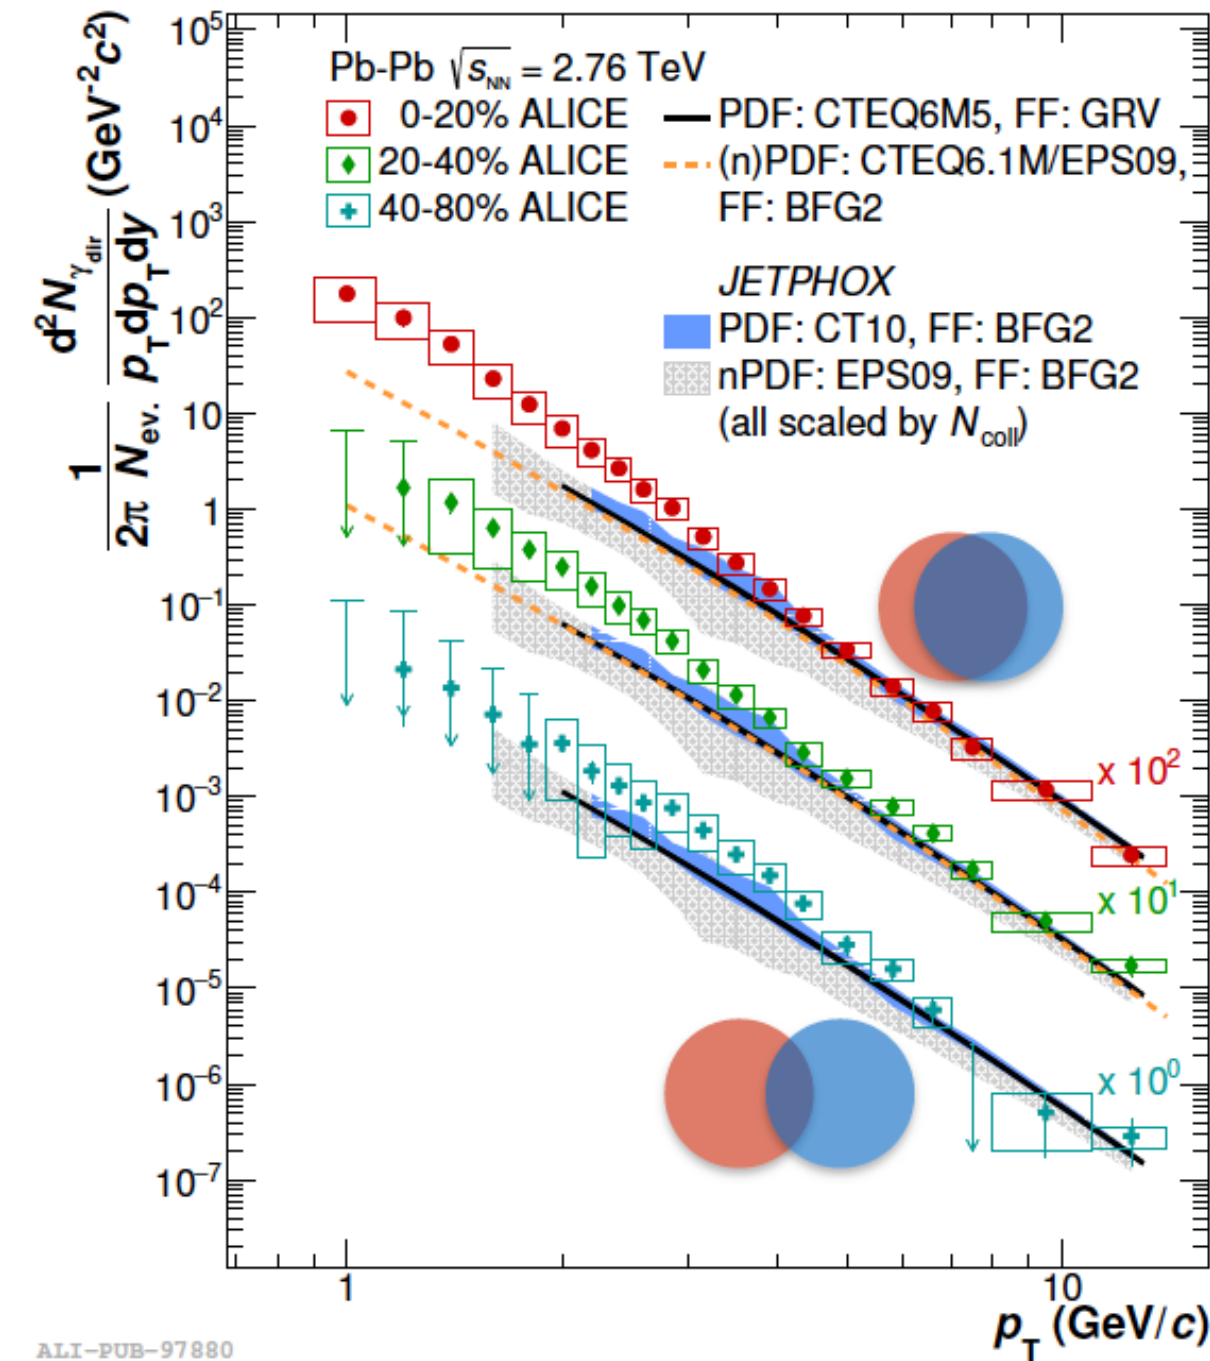

arXiv:1606.07424

- Significant enhancement of strange and multi-strange particle production
- Follows the trend observed in p-Pb, despite differences in initial state
- MC predictions do not describe this observation satisfactorily
- Observed increase is more pronounced for baryons with higher strangeness content

Direct photons in Pb-Pb collisions

ALICE Phys. Lett. B754 (2016) 235

- Low p_T : 2.6 σ excess w.r.t. models in 0-20% central \rightarrow thermal radiation
- $T_{eff} = 304 \pm 11$ (stat.) ± 40 (sys) MeV extracted in 0-20% central
- 30% higher than at RHIC @ 200 GeV

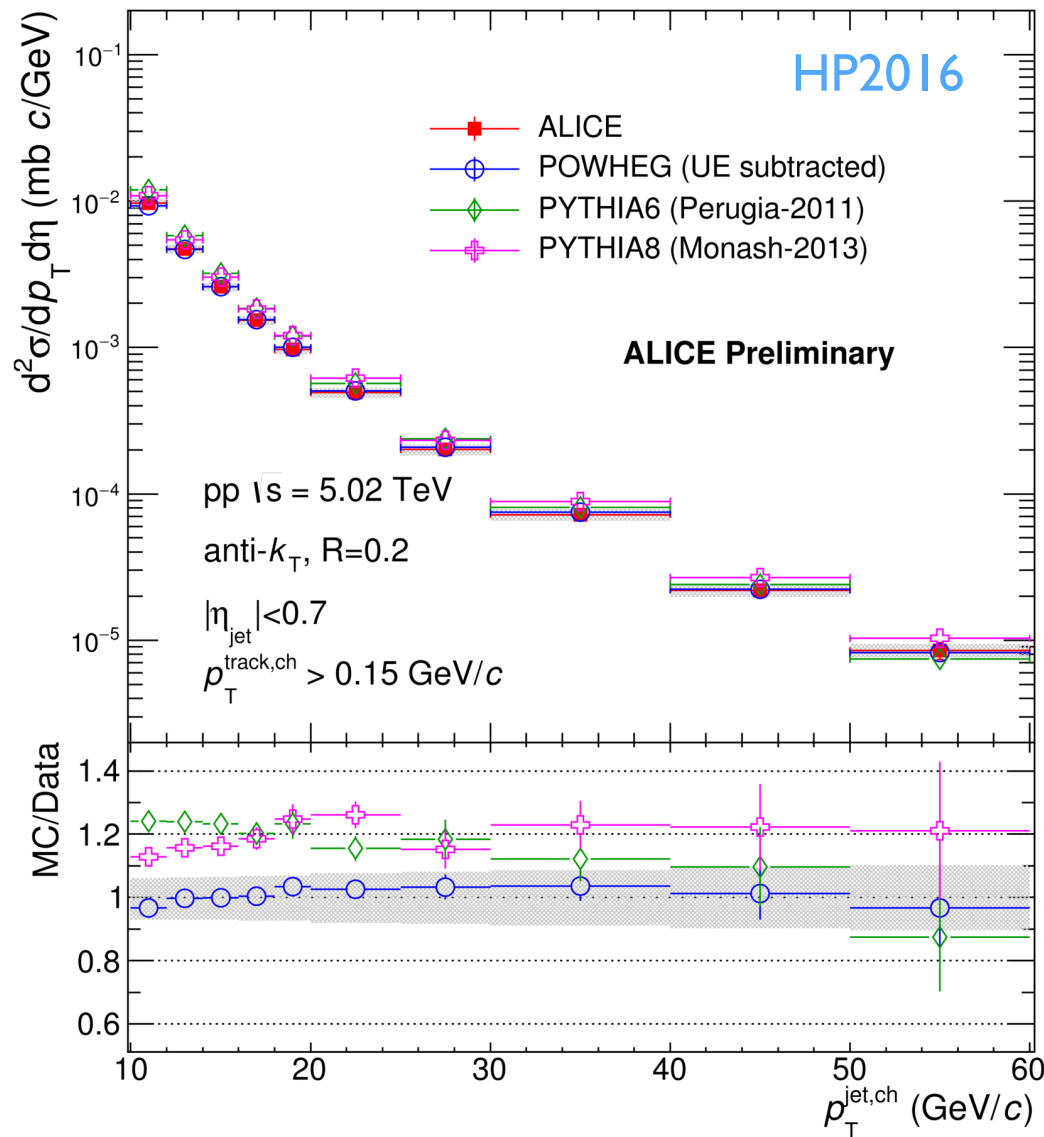

π^0 -hadron correlations at LHC

PLB 763 (2016) 238

- Extend the measurement to lower p_T compared to charged di-hadron correlation measurements
- Enhancement at very low p_T , indicating extra particles from soft or fragmentation functions
- Suppression on the away side for high p_T , consistent with “conformal” quenching

jet cross sections in pp at 5.02 TeV

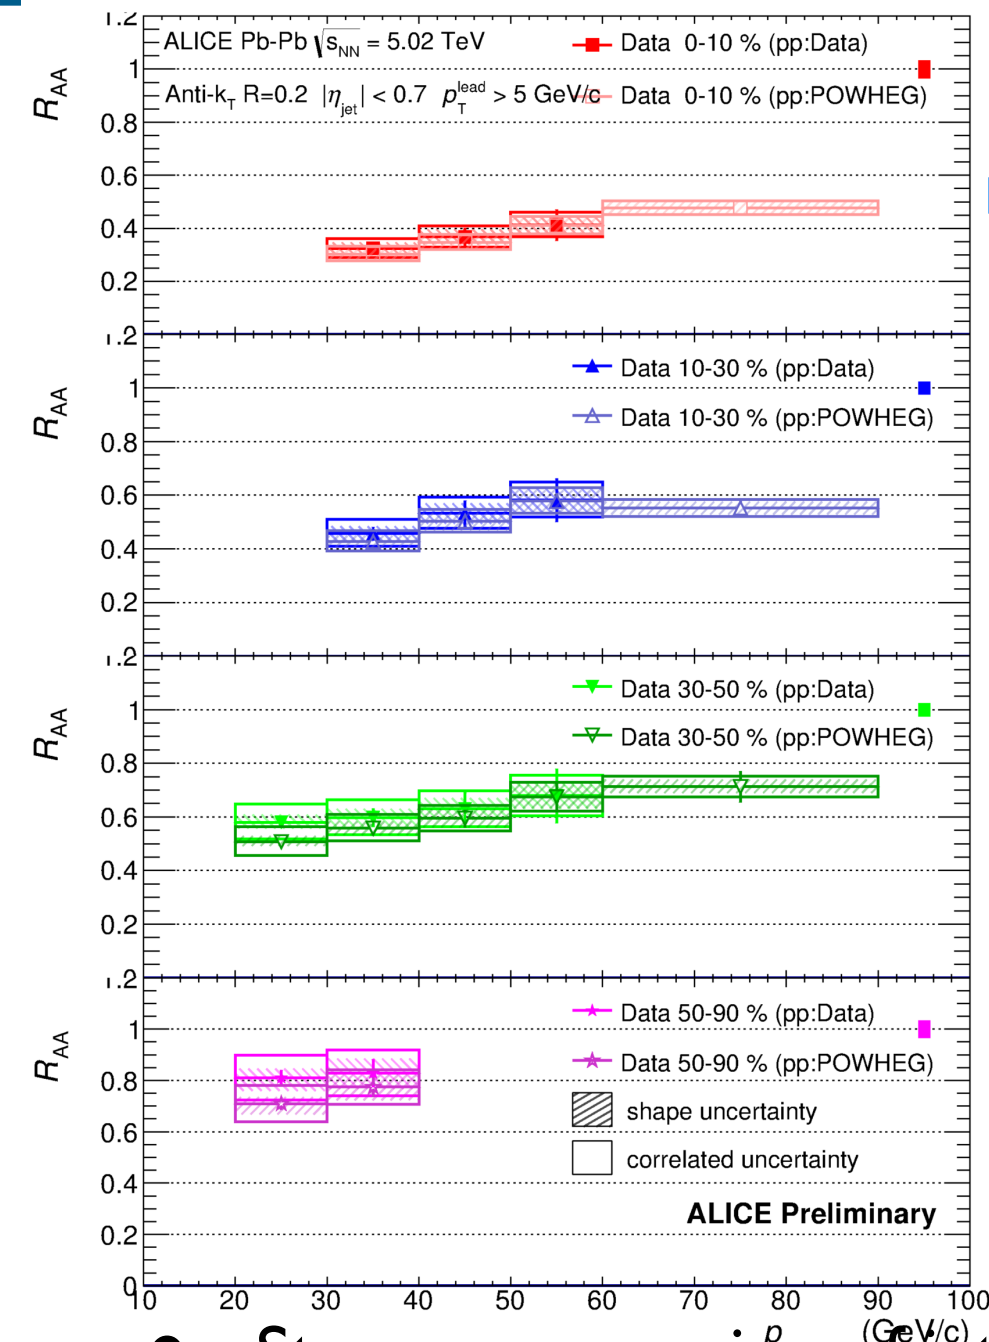

- Jet cross section is well described by POWHEG NLO calculations within systematic uncertainties
- Cross section ratio between $R = 0.2/R = 0.4$ consistent with model calculations, slightly increasing with jet $p_T \rightarrow$ reflect jet collimation information info

Jet nuclear modification factor R_{AA}

$$R_{AA} = \frac{1}{\langle N_{coll} \rangle} \frac{d^2 N_{AA} / dp_T d\eta}{d^2 N_{pp} / dp_T d\eta}$$

HP2016

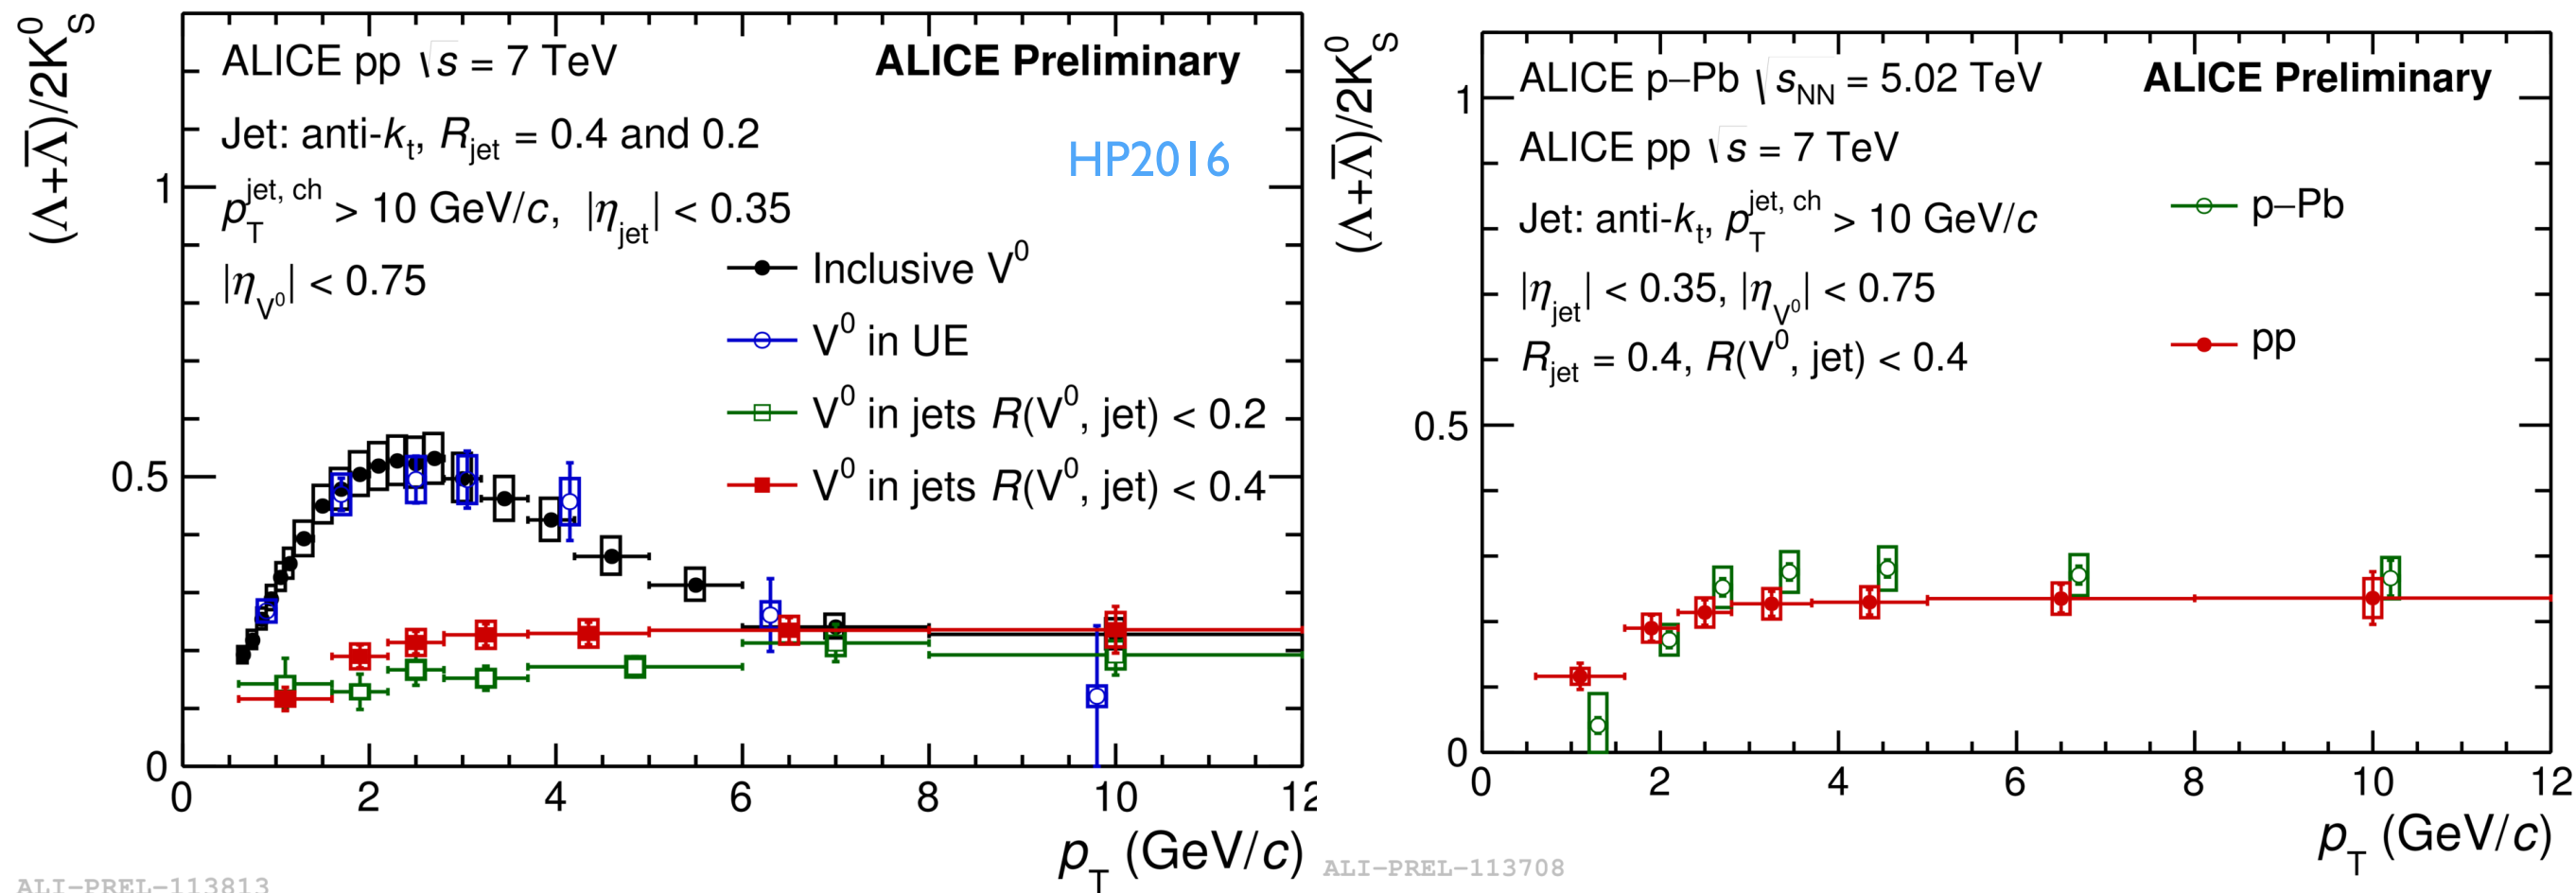

- Strong suppression of jet yield in most central collisions
- R_{AA} at 5.02 TeV similar to 2.76 TeV
- ➔ “compensation” between increasing suppression and modification of the shape of the spectra

Jet peak broadening

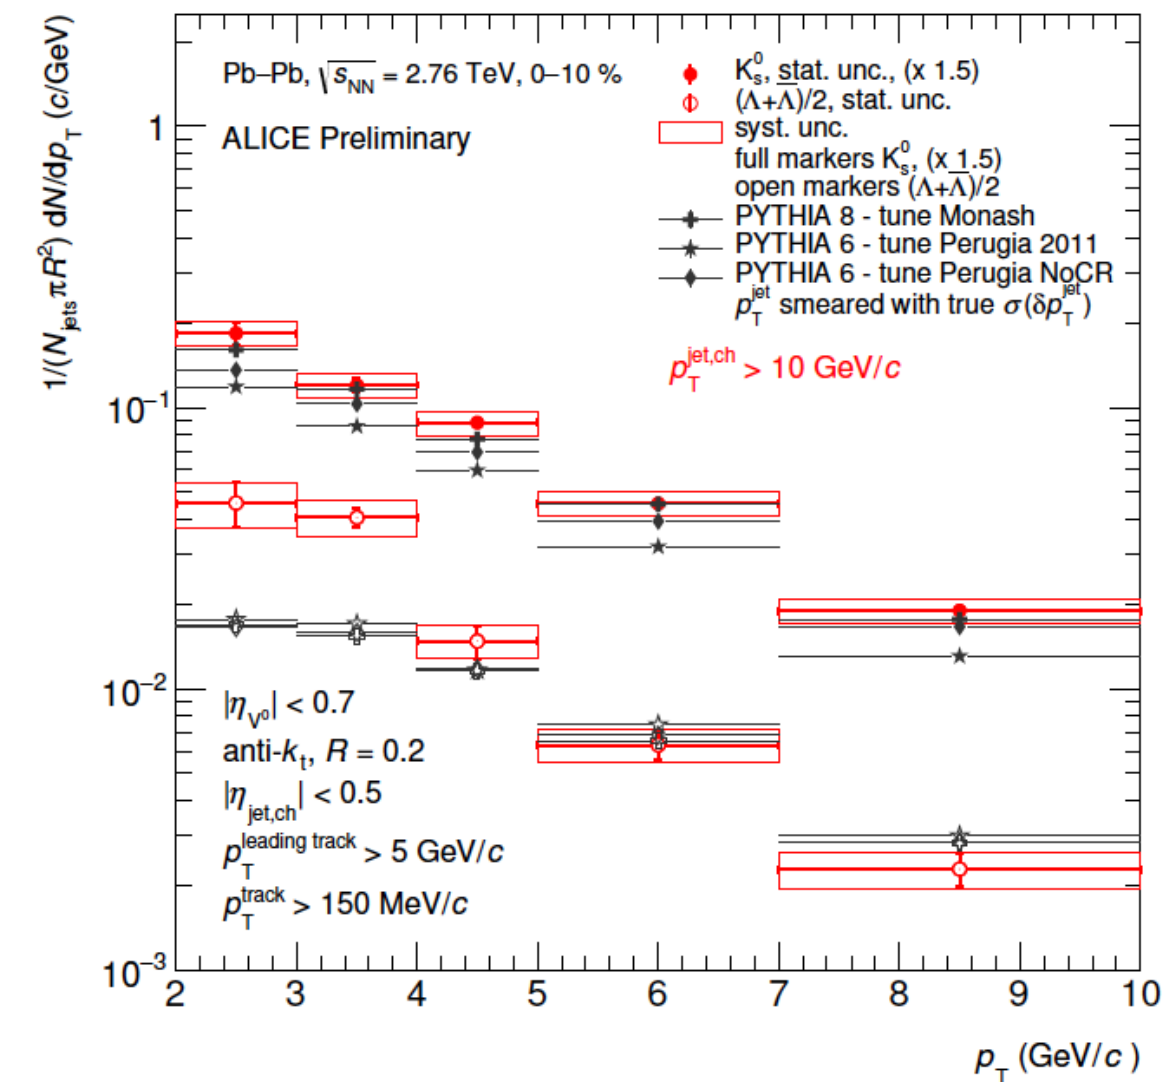

- Width in $\Delta\phi$ in 50-80% is equal to pp
 - Small increase at low p_T in $\Delta\phi$ with centrality
 - Very pronounced increase at low p_T in $\Delta\eta$
- ➔ Similar measurements can be pursued with jet axis

V^0 production in jet

- K_s^0 and Λ in the UE region - consistent with inclusive measurements
- Λ/K_s^0 ratio in jets is unambiguously different from the UE (and inclusive)
- Slightly decrease of the ratio with decreasing $R(V_0, \text{jet})$
- The ratio is flat with $p_{T,V^0} > 3$ GeV/c, and consistent with inclusive V_0 s at high p_T
- pp consistent with p-Pb within uncertainties in jet $R = 0.4$

K_S^0 and Λ production in jets

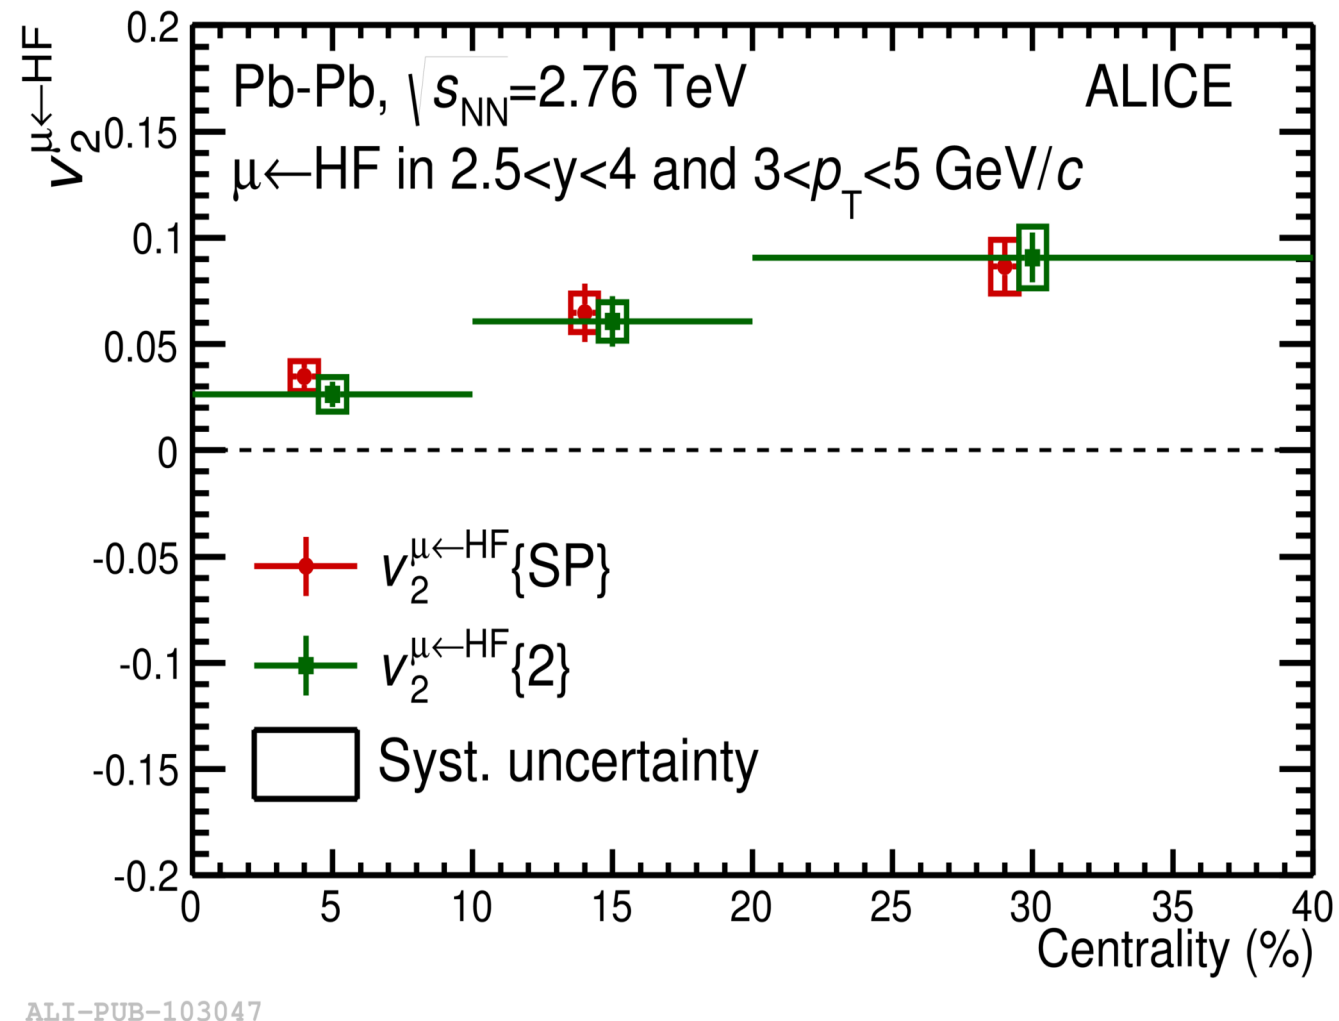

ALI-PREL-112798

- K_S^0 and Λ production in charged-particle jets in Pb–Pb collisions
- Reference PYTHIA smeared with background fluctuations
- K_S^0 data consistent with PYTHIA
- within errors - hint of low- p_T enhancement in data
- Λ : data significantly higher than PYTHIA at low p_T

- Investigating medium modified fragmentation, effect seems to differ between baryons and mesons — further constraints on reference from data needed

Azimuthal anisotropy

- Elliptic flow (v_2): spatial anisotropy - pressure gradients lead to momentum anisotropy
—hydrodynamics $v_n = \langle \cos n(\varphi - \Psi_{RP}) \rangle$

- Increase of v_2 from central to semi-central collisions in centrality range 0-40%
- Observed a positive v_2 in semi-central collisions at intermediate p_T
- Indication of strong interaction of heavy flavors with the hot and dense medium

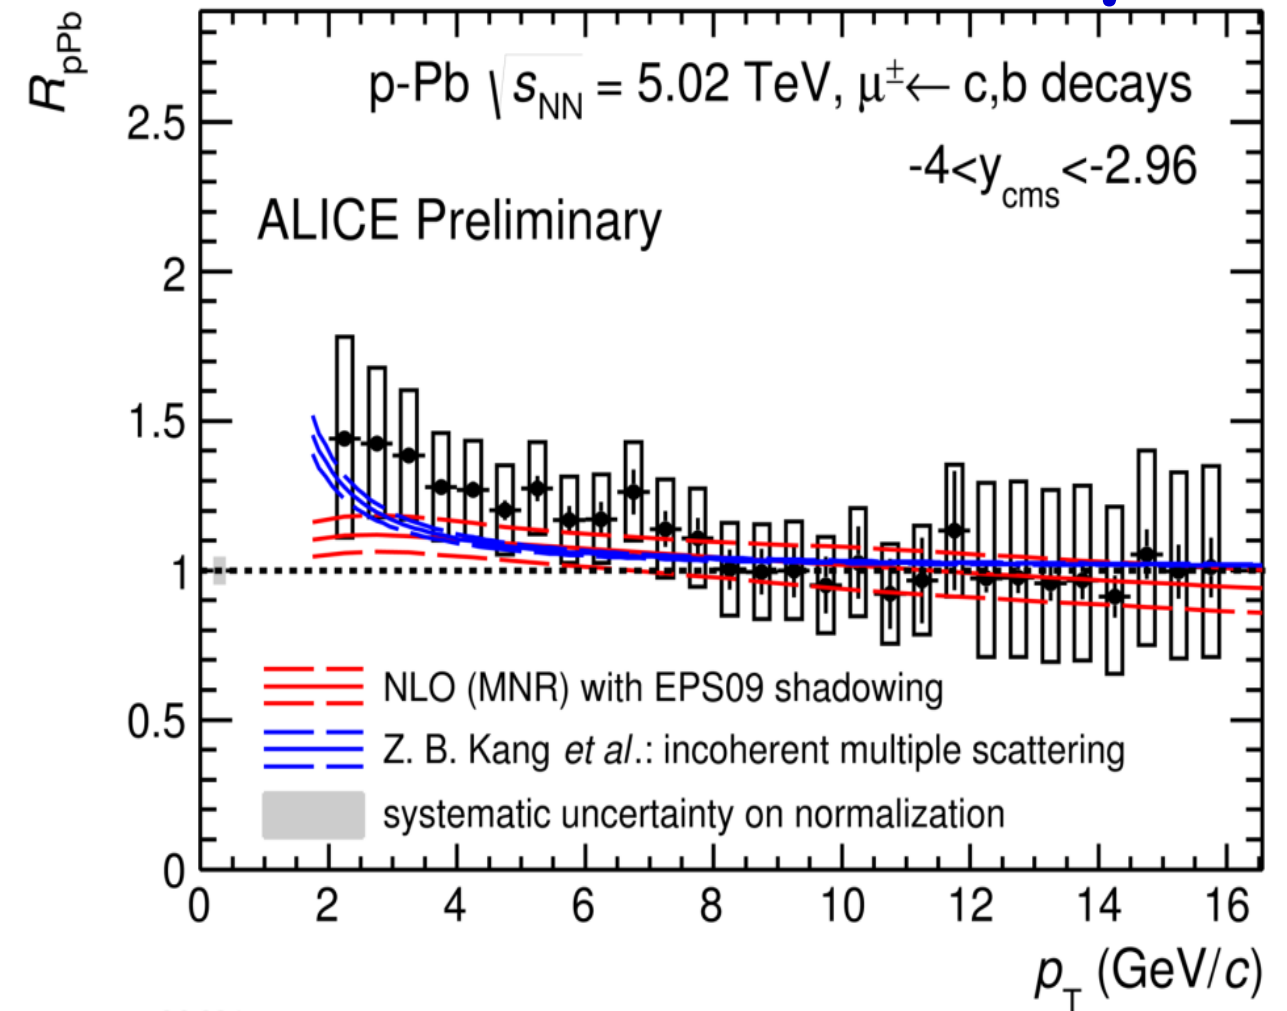

Heavy-flavour decay muons R_{pA}

QM2015

ALI-PREL-90686

ALI-PREL-90691

- Consistent with unity at backward (Pb-going, left) and forward (p-going, right) rapidity at high p_T
→ Backward rapidity: slightly larger than unity in $2 < p_T < 4$ GeV/c
- Data described within uncertainties by model calculations that include cold nuclear matter effects

pQCD NLO (MNR): Nucl. Phys. B 373 (1992) 295; EPS09: JHEP 04 (2009) 065 ;
Z. B. Kang *et al.*: PLB 740 (2015) 23 ; I. Vitev: PRC 75 (2007) 064906

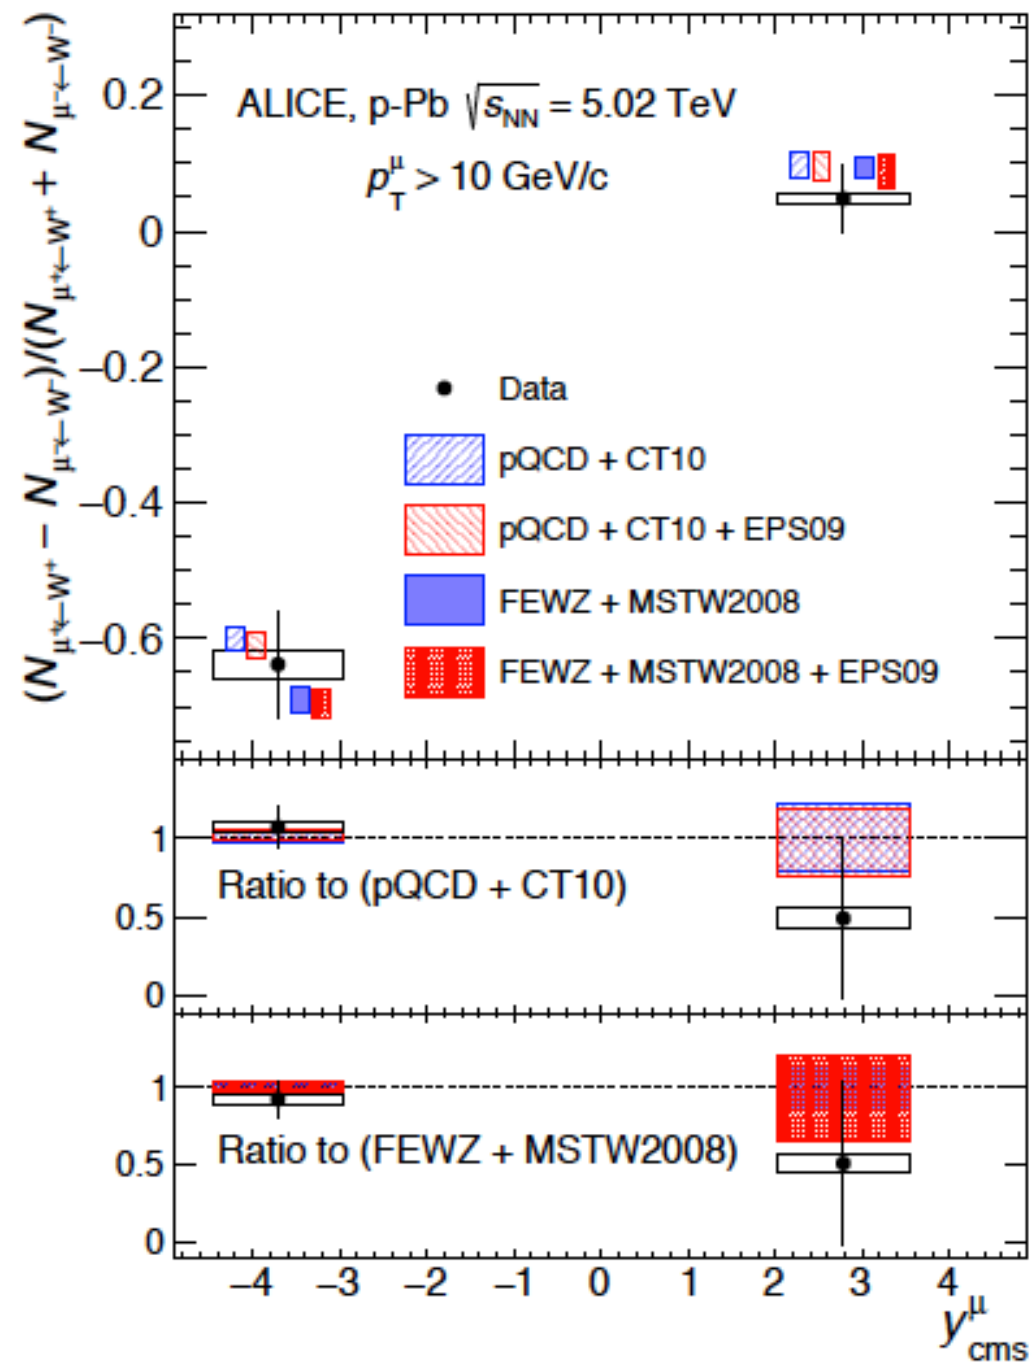

R_{AA} of muons from heavy-flavor decay

PLB 753 (2016) 41

- Clear increase of the suppression for more central events: about a factor 3 in 0-10% at p_T ($7 < p_T < 12$ GeV/c)
- No clear p_T dependence within uncertainties

W/Z boson productions in p-Pb collisions

ALICE (朱剑辉, 周代翠等): arXiv:1611.03002, JHEP in prep

- Measurement of the VV production cross section in p-Pb collisions via the semi-leptonic decays of VV bosons in the muon channel.
- Measured cross section well described by NLO pQCD calculation with CT10 PDF and EPS09 shadowing parameterization
- Yield/ $\langle N_{coll} \rangle$ vs. event activity with different estimators is constant within uncertainties

Conclusions

- ALICE has collected a wealth of data through LHC run1 and is now enriching its data sample in run2
- From the study of the hottest lump of matter created up to now at particle accelerators
 - Confirm effects seen at SPS/RHIC extending them to a new energy scale
 - Bring new discoveries, and among them
 - ➡ Jets are strongly affected by the medium
 - ➡ Mass-dependence of heavy quark energy loss
- No qualitatively different effects are expected moving from $\sqrt{s_{NN}}=2.76$ to 5.02 TeV, but the quality of the results is improved, thanks to higher luminosities and better understanding of the apparatus
- Many more to come...stay tuned!
- Physics program extending into run 3 and run 4 thanks to the substantial upgrades foreseen for LS2

ALICE upgrade program (for Run3)

New Inner Tracking System (ITS)

- improved pointing precision
- less material → thinnest tracker at the LHC

Time Projection Chamber (TPC)

- new GEM technology for readout chambers
- continuous readout
- faster readout electronics

New Central Trigger Processor (CTP)

Data Acquisition (DAQ)/ High Level Trigger (HLT)

- new architecture
- on line tracking & data compression
- 50kHz Pbb event rate

Muon Forward Tracker (MFT)

- new Si tracker
- Improved μ pointing precision

MUON ARM

- continuous readout electronics

TOF, TRD, ZDC

- Faster readout

New Trigger Detectors (FIT)
