

Secondary electron yield of nano-thick aluminum oxide and its application on MCP detector

Thursday, May 25, 2017 2:54 PM (18 minutes)

The secondary electron properties of nano-thick aluminum oxide have been studied. The MCP assembly performance improvement through coating aluminum oxide is investigated. The gain, the charge resolution and the peak-to-valley ratio of the MCP detector are improved. Two possible solutions are proposed to improve the maximum yield with reduced optimal energy of secondary electron emission materials.
