

Neutrino physics and detectors

Wednesday, 24 May 2017 09:30 (30 minutes)

Recent development of detectors for neutrino intrinsic property measurements and neutrino oscillations are reviewed, including low background detectors for searching for the neutrino-less double beta decay, water Cherenkov, liquid Argon TPC, liquid scintillator for neutrino oscillations. Such technologies had significant progresses in the past a few years and further steps are planned for the future.

Presenter: Dr WEN, Liangjian (高能所)

Session Classification: Plenary 3
