

### NUCLEAR PDFs AND HEAVY QUARK(ONIUM) PRODUCTION IN PROTON-NUCLEUS COLLISIONS

#### **J.P. Lansberg** IPN Orsay – Paris-Sud U. –CNRS/IN2P3 – Université Paris-Saclay

### Quarkonium 2017

The 12th International Workshop on Heavy Quarkonium

November 6-10, 2017, Peking University, Beijing, China

in collaboration with M. Cacciari, A. Kusina, I. Schienbein and H.S. Shao

J.P. Lansberg (IPNO)

nPDF and heavy quark(onium) in pA collisions

November 8, 2017 1 / 17

### Part I

### Introduction

J.P. Lansberg (IPNO)

nPDF and heavy quark(onium) in pA collisions

November 8, 2017 2 / 17

3

• Nuclear modification of the parton densities, nPDF: initial-state effect

Analogous aspects to that of saturation/CGC: see K. Watanabe's talk

- Nuclear modification of the parton densities, nPDF: initial-state effect Analogous aspects to that of saturation/CGC: see K. Watanabe's talk
- Energy loss (w.r.t to pp collisions): initial-state or final-state effect

- Nuclear modification of the parton densities, nPDF: initial-state effect Analogous aspects to that of saturation/CGC: see K. Watanabe's talk
- Energy loss (w.r.t to pp collisions): initial-state or final-state effect
- Break up of the quarkonium in the nuclear matter: final-state effect

- Nuclear modification of the parton densities, nPDF: initial-state effect Analogous aspects to that of saturation/CGC: see K. Watanabe's talk
- Energy loss (w.r.t to pp collisions): initial-state or final-state effect
- Break up of the quarkonium in the nuclear matter: final-state effect
- Break up by comoving particles: final-state effect

which make sense if nPDF are the only nuclear effect

- Conversely, one can test this hypothesis by comparing our curves with data
  Global agreement <sup>?</sup>→ only nPDFs matter
- One can go further in the data comparison with reweighting (see later) and then HF-data inclusion in nPDF fits
- Bonus: since the *pp* yields are fit, the procedure sometimes hints at normalisation issues (absent in *R*<sub>FB</sub>) which could otherwise be misinterpreted as nuclear suppressions/enhancements

JPL, H.S. Shao Eur.Phys.J. C77 (2017) 1

• Extensive comparisons directly with data,

which make sense if nPDF are the only nuclear effect

- Conversely, one can test this hypothesis by comparing our curves with data Global agreement  $\stackrel{?}{\Rightarrow}$  only nPDFs matter
- One can go further in the data comparison with reweighting (see later) and then HF-data inclusion in nPDF fits
- Bonus: since the *pp* yields are fit, the procedure sometimes hints at normalisation issues (absent in *R*<sub>FB</sub>) which could otherwise be misinterpreted as nuclear suppressions/enhancements
- Last but not least: the automation of the evaluation allows one to study different nPDF sets AND the scale uncertainties: better control of the theory uncertainties

æ

1. Convert Hessian error PDFs into replicas

$$f_k = f_0 + \sum_{i}^{N} \frac{f_i^{(+)} - f_i^{(-)}}{2} R_{ki}$$

2. Calculate weights for each replica

$$w_k = \frac{e^{-\frac{1}{2}\chi_k^2/T}}{\frac{1}{N_{\rm rep}}\sum_i^{N_{\rm rep}}e^{-\frac{1}{2}\chi_k^2/T}}, \qquad \chi_k^2 = \sum_j^{N_{\rm data}}\frac{(D_j - T_j^k)^2}{\sigma_j^2}$$

3. Calculate observables with new (reweighted) PDFs

$$\begin{split} \left< \mathcal{O} \right>_{\mathrm{new}} &= \frac{1}{N_{\mathrm{rep}}} \sum_{k=1}^{N_{\mathrm{rep}}} w_k \mathcal{O}(f_k), \\ \delta \left< \mathcal{O} \right>_{\mathrm{new}} &= \sqrt{\frac{1}{N_{\mathrm{rep}}} \sum_{k=1}^{N_{\mathrm{rep}}} w_k \left( \mathcal{O}(f_k) - \left< \mathcal{O} \right> \right)^2}. \end{split}$$

- \* N is the # of eigensets, N<sub>rep</sub> is the # of constructed replicas
- \* f<sub>0</sub> is the "central-value" of the nPDF vector (*i.e.* of functions of x) in N<sub>flavour</sub> dimension
- f<sub>i</sub><sup>(±)</sup> (i ∈ [1 : N]) is the "upper/lower value" function of a given eigenset i
- *R<sub>ki</sub>* is a number randomly choosen for each set of (*k*, *i*) (thus fixed for all *N*<sub>flavour</sub>) according to a standard Normal distribution
- \* fk is the constructed vector
- T is the tolerance factor (for 68% CL: 13 for nCTEQ15; 19 for EPPS16)

イロト イポト イヨト イヨト

November 8, 2017 11 / 17

1. Convert Hessian error PDFs into replicas

2. Calculate weights for each replica

$$w_k = \frac{e^{-\frac{1}{2}\chi_k^2/T}}{\frac{1}{N_{\rm rep}}\sum_i^{N_{\rm rep}}e^{-\frac{1}{2}\chi_k^2/T}}, \qquad \chi_k^2 = \sum_j^{N_{\rm data}}\frac{(D_j - T_j^k)^2}{\sigma_j^2}$$

3. Calculate observables with new (reweighted) PDFs

$$\begin{split} \left\langle \mathcal{O} \right\rangle_{\mathrm{new}} &= \frac{1}{N_{\mathrm{rep}}} \sum_{k=1}^{N_{\mathrm{rep}}} w_k \mathcal{O}(f_k), \\ \delta \left\langle \mathcal{O} \right\rangle_{\mathrm{new}} &= \sqrt{\frac{1}{N_{\mathrm{rep}}} \sum_{k=1}^{N_{\mathrm{rep}}} w_k \left( \mathcal{O}(f_k) - \langle \mathcal{O} \rangle \right)^2}. \end{split}$$

- \* N is the # of eigensets, N<sub>rep</sub> is the # of constructed replicas
- \* f<sub>0</sub> is the "central-value" of the nPDF vector (*i.e.* of functions of *x*) in N<sub>flavour</sub> dimension
- f<sub>i</sub><sup>(±)</sup> (i ∈ [1 : N]) is the "upper/lower value" function of a given eigenset i
- \*  $R_{ki}$  is a number randomly choosen for each set of (k, i) (thus fixed for all  $N_{\text{flavour}}$ ) according to a standard Normal distribution
- \* *f<sub>k</sub>* is the constructed vector
- *T* is the tolerance factor (for 68% CL: 13 for nCTEQ15; 19 for EPPS16)

イロン イヨン イヨン イヨン

- Global data (or theory) uncertainties can be dealt with adjusting  $T_i^k$
- When a replica *k* describes well the data, it gets a higher weight  $w_k$  thanks to a smaller  $\chi_k^2$
- The nPDF are then modified –reweighted– since the initial set of replicas is altered. If replicas closer to (further from) the central value are favoured, the nPDF uncertainty is reduced (enlarged). nPDF uncertainties for any flavour can easily be redrawn
- Any other observables can also be redrawn ( $pA d\sigma$ ,  $R_{pA}$ ,  $R_{FB}$ , ...)

November 8, 2017 11 / 17

• Global coherence of the data constraints: necessary condition to assume a shadowing-only approach

- Global coherence of the data constraints: necessary condition to assume a shadowing-only approach
- First clear experimental observation on gluon SHADOWING at low *x*; Visible reduction of the EPPS16 uncertainties; confirmation of the extrapolation done in nCTEQ15

- Global coherence of the data constraints: necessary condition to assume a shadowing-only approach
- First clear experimental observation on gluon SHADOWING at low *x*; Visible reduction of the EPPS16 uncertainties; confirmation of the extrapolation done in nCTEQ15
- The scale ambiguity for *D* and  $J/\psi$  production is now the dominant uncertainty

- Global coherence of the data constraints: necessary condition to assume a shadowing-only approach
- First clear experimental observation on gluon SHADOWING at low *x*; Visible reduction of the EPPS16 uncertainties; confirmation of the extrapolation done in nCTEQ15
- The scale ambiguity for *D* and  $J/\psi$  production is now the dominant uncertainty
- Non-prompt  $J/\psi$  are really promising if improved data can be obtained

- Global coherence of the data constraints: necessary condition to assume a shadowing-only approach
- First clear experimental observation on gluon SHADOWING at low *x*; Visible reduction of the EPPS16 uncertainties; confirmation of the extrapolation done in nCTEQ15
- The scale ambiguity for *D* and  $J/\psi$  production is now the dominant uncertainty
- Non-prompt  $J/\psi$  are really promising if improved data can be obtained
- Confirmation of the existence of a gluon anti-shadowing :  $R_g(0.05 \le x \le 0.1) > 1$

J.P. Lansberg (IPNO)

November 8, 2017 15 / 17

• Gluon nPDFs at low *x* are extrapolated : indeed no low *x* data used in fits

 $\rightarrow$  need for new constraints at  $x \le 10^{-3}$ 

- Gluon nPDFs at low x are extrapolated : indeed no low x data used in fits  $\rightarrow$  need for new constraints at  $x \le 10^{-3}$
- We have proposed a quick and robust method to evaluate nPDF effects complementary to full (but time consuming) pQCD computations

- Gluon nPDFs at low x are extrapolated : indeed no low x data used in fits  $\rightarrow$  need for new constraints at  $x \le 10^{-3}$
- We have proposed a quick and robust method to evaluate nPDF effects – complementary to full (but time consuming) pQCD computations
- With standard data-theory comparisons, and then with the (n)PDF Bayesian reweighting technique, we tested –and validated– a shadowing-only hypothesis with D,  $J/\psi$ ,  $B \rightarrow J/\psi$  and  $\Upsilon(1S)$  data

- Gluon nPDFs at low x are extrapolated : indeed no low x data used in fits  $\rightarrow$  need for new constraints at  $x \le 10^{-3}$
- We have proposed a quick and robust method to evaluate nPDF effects complementary to full (but time consuming) pQCD computations
- With standard data-theory comparisons, and then with the (n)PDF Bayesian reweighting technique, we tested –and validated– a shadowing-only hypothesis with  $D, J/\psi, B \rightarrow J/\psi$  and  $\Upsilon(1S)$  data
- Under this hypothesis, we argue for an experimental observation of gluon shadowing and antishadowing

- Gluon nPDFs at low x are extrapolated : indeed no low x data used in fits  $\rightarrow$  need for new constraints at  $x \le 10^{-3}$
- We have proposed a quick and robust method to evaluate nPDF effects complementary to full (but time consuming) pQCD computations
- With standard data-theory comparisons, and then with the (n)PDF Bayesian reweighting technique, we tested and validated– a shadowing-only hypothesis with  $D, J/\psi, B \rightarrow J/\psi$  and  $\Upsilon(1S)$  data
- Under this hypothesis, we argue for an experimental observation of gluon **shadowing** and **antishadowing**
- For the first time, we thoroughly considered the scale uncertainty  $(\mu_F)$
- For the charm sector, it seems to induce

#### uncertainties as large as the nPDF reweighted range !

• The scale uncertainty cannot be neglected and is a known issue for the  $J/\psi$ PbPb UPC data interpretation

- Gluon nPDFs at low x are extrapolated : indeed no low x data used in fits  $\rightarrow$  need for new constraints at  $x \le 10^{-3}$
- We have proposed a quick and robust method to evaluate nPDF effects complementary to full (but time consuming) pQCD computations

- For the charm sector, it seems to induce

#### uncertainties as large as the nPDF reweighted range !

- The scale uncertainty cannot be neglected and is a known issue for the  $J/\psi$ PbPb UPC data interpretation
- Heavy-flavour leptons could be added to the list as well as other differential data [no drastic change expected with the current data]

J.P. Lansberg (IPNO)

nPDF and heavy quark(onium) in pA collisions

### MUNICH Institute for Astro- and Particle Physics

Probing the Quark-Gluon Plasma with Collective Phenomena and Heavy Quarks 27 August - 21 September 2018 Torsten Dahms, Laura Fabbietti, Jean-Philippe Lansberg, Jean-Yves Ollitrault

will start with a 3-day topical workshop (August 27 to 29, 2018)

Registration form and further information at http://www.munich-iapp.de/programmes-topical-workshops/2018/heavy-ion/

MIAPP requires attendance for at least two weeks to support the participants

The registration deadline is November 27, 2017

Submission of proposals/application for programme participation:
