

Summary so far:

★ spinor-helicity method $A(\langle ij \rangle, [i; j])$

★ BCFW on-shell recursion

QCD @ tree-level was extremely simple!

$$A(1^- 2^- \dots n^-) = 0$$

$$A(1^- 2^- \dots (n-1)^- n^+) = 0$$

$$A(1^- 2^- 3^+ \dots n^+) =$$

$$\frac{\langle 12 \rangle^4}{\langle 12 \rangle \langle 23 \rangle \dots \langle n1 \rangle} \quad (\text{Parke, Taylor})$$

Maximal Helicity Violating (MHV)

$d\sigma \sim \sum_{\text{helicities}} |A|^2$ use parity symmetry
 $\langle \rangle \leftrightarrow []$
 $+ \leftrightarrow -$

$$A(1^+ 2^+ 3^- \dots n^-) = \frac{[12]^4}{[12][23] \dots [n1]}$$

but adding more -ve helicities
 makes the amplitudes more
 complicated.

• counting complexity

n	3	4	5	6	7	8
N_n	6	4	25	220	2485	34300
N_n^{ord}	1	3	10	38	154	654
MHV	1	1	1	1	1	1
NMHV	-	-	-	2	6	18

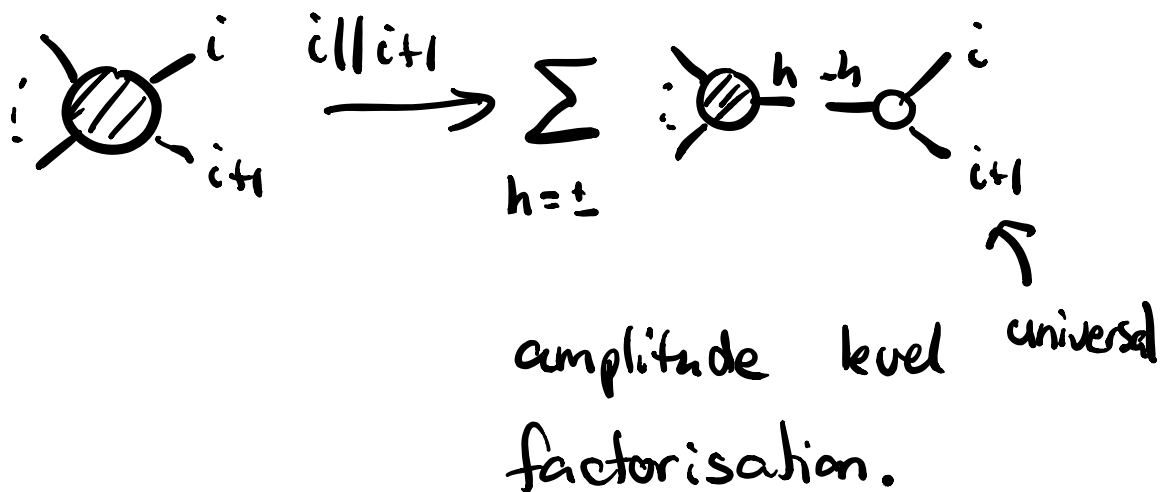

$$\begin{array}{cccccc}
 NMHV & - & - & - & - & 10 \\
 N^2MHV & - & - & - & - & 20
 \end{array}$$

$NMHV$ 3^{-ve} hel.

N^2MHV 4^{-ve} hel.

• Parke Taylor denominator
has a special cyclic form:

satisfies all collinear limits

unitarity $S^\dagger S = 1 \Rightarrow$

$$\text{Disc}_{P \rightarrow P'} \left(P \text{---} \text{---} P' \right) = \sum_k \int P \text{---} \text{---}^k \text{---} \text{---} P' \quad (*)$$

$$P \text{---} \text{---} P' = \underbrace{g_{L0}}_{\text{leading order coupling}} \left(P \text{---} \text{---} P' + g^2 \text{---} \text{---} + g^4 \text{---} \text{---} + \dots \right)$$

expand pert. on both sides of (*)

$$g_{L0} \left(\text{Disc} \left(\text{---} \text{---} \right) + g^2 \text{Disc} \left(\text{---} \text{---} \right) + g^4 \text{Disc} \left(\text{---} \text{---} \right) + \dots \right)$$

$$\begin{aligned}
&= g_{\text{LO}} \left(g^2 \int_{l_1, l_2} \text{diagram}_1 + g^4 \int_{l_1, l_2} \text{diagram}_2 \right. \\
&+ g^4 \int_{l_1, l_2} \text{diagram}_3 + g^4 \int_{l_1, l_2, l_3} \text{diagram}_4 \\
&\left. + \dots \right)
\end{aligned}$$

$$\Rightarrow \text{Disc}_{p \rightarrow p'} \left(\text{diagram}_1 \right) = 0$$

$$\text{Disc}_{p \rightarrow p'} \left(\text{diagram}_2 \right) =$$

$$\int_{l_1, l_2} \text{diagram}_1$$

$$\text{Disc}_{p \rightarrow p'} \left(\text{diagram}_3 \right) = \int_{l_1, l_2} \left(\text{diagram}_2 \right.$$

$$+ \text{diagram}_3 \left. \right) + \int_{l_1, l_2, l_3} \text{diagram}_4$$

more explicity

$$\int_{\ell_1, \ell_2} P \text{ (diagram) } P'$$

$$= \int d\text{LIPS}(\ell_1, \ell_2; P')$$

$$\sum_{\substack{h_1, h_2 \\ = \pm}} P \text{ (diagram) } P' \text{ (diagram)}$$

$$d\text{LIPS}(\ell_1, \ell_2, P') = \frac{1}{(2\pi)^2}$$

$$\times d^4 \ell_1 d^4 \ell_2 \delta^{(+)}(\ell_1) \delta^{(+)}(\ell_2)$$

$$\times \delta^{(+)}(-\ell_1 + \ell_2 + P')$$

Reconstruct amplitude by summing
over all cuts (i.e. different
channels $t \rightarrow p'$)

everything is on-shell .

One-loop amplitudes for $4g$ scattering

$A^{(1)}(1^- 2^- 3^+ 4^+)$ in $\mathcal{N}=4$ SYM

(super-symmetric
yang-mills theory)

$\mathcal{N}=4$ is a toy model for QCD
particle spectrum

(gluons, \pm), (gluinos, \pm), (scalars,
complex)

$$\begin{aligned}
 A^{(1)}[N=4] &= A^{(1)}[\text{gluon}] \\
 &+ 4 A^{(1)}[\text{gluino}] \\
 &+ 3 A^{(1)}[\text{scalar}]
 \end{aligned}$$

See $N=4$ as part of QCD
at 1-loop.

$$\begin{aligned}
 A^{(1), \text{QCD}} &= A^{(1)}[\text{gluon}] \\
 &+ n_f A^{(1)}[\text{quark}] \\
 &+ n_s A^{(1)}[\text{scalar}] \\
 &= (A^{(1)}[g] + 4 A^{(1)}[q] + 3 A^{(1)}[s]) \\
 &+ (4 - n_f) (-A^{(1)}[g] - A^{(1)}[s])
 \end{aligned}$$

$$+ (1 - n_f + n_s) A^{(1)}[s]$$

1st term $N = 0$

2nd term $N = 1$ chiral

3rd term $N = 0$ scalar

now compute the S_{12} discontinuity

$$\text{Disc}_{S_{12}} \left(\begin{array}{c} 4^+ \\ \swarrow \\ \text{---} \text{---} \text{---} \text{---} \\ \searrow \\ 1^- \\ \text{---} \text{---} \text{---} \text{---} \\ \swarrow \\ 2^- \\ \searrow \\ 3^+ \end{array} \right)$$

$$= \int_{\epsilon_1, \epsilon_2} \sum_{\uparrow} \begin{array}{c} 4^+ \\ \swarrow \\ \text{---} \text{---} \text{---} \text{---} \\ \searrow \\ e_1 \\ \text{---} \text{---} \text{---} \text{---} \\ \swarrow \\ e_2 \\ \searrow \\ 1^- \\ \text{---} \text{---} \text{---} \text{---} \\ \swarrow \\ 2^- \\ \searrow \\ 3^+ \end{array}$$

sum is over all states

$$g^\pm, q^\pm, s(s^*)$$

don't contribute due

to current conservation.

$$= \int_{l_1, l_2, 3^+} q^+ \text{ [Diagram 1]} \text{ [Diagram 2]}$$

The diagrams show two vertices. The first vertex has incoming lines labeled l_1^- and l_2^- , and an outgoing line labeled 3^+ . The second vertex has incoming lines labeled l_1^+ and l_2^+ , and an outgoing line labeled 2^- .

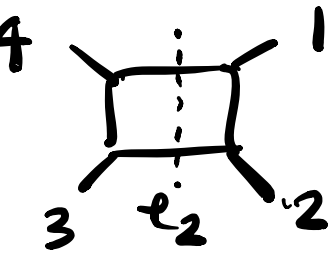

$$= \int_{l_1, l_2} \frac{\langle l_1(-l_2) \rangle^3}{\langle (-l_2)3 \rangle \langle 34 \rangle \langle 4l_1 \rangle}$$

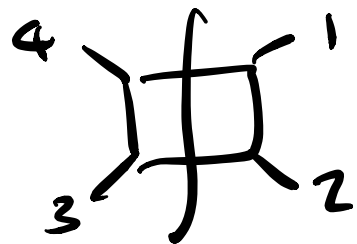

$$\times \frac{\langle 12 \rangle^3}{\langle 2l_2 \rangle \langle l_2(l_1) \rangle \langle (-l_1)1 \rangle}$$

$$= \int_{l_1, l_2} \frac{\langle 12 \rangle^3}{\langle 34 \rangle} \frac{\langle l_1, l_2 \rangle^2}{\langle l_23 \rangle \langle 4l_1 \rangle \langle 2l_2 \rangle \langle l_1 \rangle}$$

$$= \int_{l_1, l_2} \frac{-\langle 12 \rangle^3}{\langle 23 \rangle \langle 34 \rangle \langle 41 \rangle} \frac{S_{12} S_{14}}{(l_2 - p_3)^2 (l_2 + p_2)^2}$$

(use spinor-helicity algebra)

$$= - \frac{\langle 12 \rangle^3}{\langle 23 \rangle \langle 34 \rangle \langle 41 \rangle} S_{12} S_{14} \int_{\ell_1, \ell_2} \text{box diagram}$$

$$= \frac{-\langle 12 \rangle^3}{\langle 23 \rangle \langle 34 \rangle \langle 41 \rangle} S_{12} S_{14} \text{ box diagram}$$

this channel shows

$$A = - (\text{tree}) \times S_{12} S_{14} \times (\text{box integral})$$

+ anything in S_{23} cut.

reconstruct part of the amplitude.

S_{23} channel is more complicated.

$$\text{Disc}_{S_{23}} \left(\begin{array}{c} 1^- \quad 2^- \\ \text{circle} \\ 4^+ \quad 3^+ \end{array} \right)$$

$$= \int e_1 e_2 \left(\begin{array}{c} \text{circle} \\ + \\ \text{circle} \\ + \\ 4 \text{ circles} \\ + \\ 3 \text{ circles} \end{array} \right)$$

final result is simple (as a consequence of susy)

$$\text{Disc}_{S_{23}} \left(\begin{array}{c} \text{circle} \\ \text{circle} \end{array} \right) = \frac{-\langle 12 \rangle^3}{\langle 23 \rangle \langle 34 \rangle \langle 41 \rangle}$$

$$\times S_{12} S_{14} \begin{array}{c} 4 \\ \diagup \quad \diagdown \\ \square \\ \diagdown \quad \diagup \\ 3 \quad 2 \end{array}$$

putting both channels together

$$A^{(U[N=4])}(1^- 2^- 3^+ 4^+)$$

$$= -A^{(0)}(1^- 2^- 3^+ 4^+) S_{12} S_{14} \begin{array}{c} 4 \\ \diagup \quad \diagdown \\ \square \\ \diagdown \quad \diagup \\ 3 \quad 2 \end{array}$$

this amplitude must have
the same universal IR poles
as the real radiation (Real)

$$\begin{array}{c} 4 \\ \diagup \quad \diagdown \\ \square \\ \diagdown \quad \diagup \\ 3 \quad 2 \end{array} = C_{\Gamma} \frac{2}{S_{12} S_{14}} \left(\frac{1}{\epsilon^2} \left(\frac{\mu^2}{-S_{12}} \right)^\epsilon \right)$$

$$+ \frac{1}{\epsilon^2} \left(\frac{\mu_R^2}{-S_{14}} \right)^\epsilon - \frac{1}{2} \log^2 \left(\frac{S_{12}}{S_{14}} \right) - \frac{\pi^2}{2}$$

$$A^{(1)} = I^{(1)} A^{(0)} + \text{finite}$$

$$I^{(1)} = -2 \left(\left(\frac{\mu_R^2}{-S_{14}} \right)^\epsilon + \left(\frac{\mu_R^2}{-S_{23}} \right)^\epsilon \right) \frac{1}{\epsilon^2}$$

$$C_{\pi} = \frac{\Gamma^2(1-\epsilon) \Gamma(1+\epsilon)}{(4\pi)^\epsilon \Gamma(1-2\epsilon)}$$

NB: we only computed
to coefficient in $d=4$
but put integral in $4-2\epsilon$

what about corrections to the coeff. at $O(\epsilon)$?

$$\begin{aligned} A^{(1)} &\sim c \cdot I \\ &= (c^{(0)} + \epsilon c^{(1)} + \dots) \\ &\quad \times \left(\frac{1}{\epsilon^2} I^{(-2)} + \frac{1}{\epsilon} I^{(-1)} + \dots \right) \end{aligned}$$

higher order terms in the coefficient can contribute the the amplitude $\sim \frac{\epsilon}{\epsilon}$

I need $d = 4 - 2\epsilon$ cuts to

reconstruct them.

$$A^{(1)} = C^{(0)} \cdot I + R + O(\epsilon)$$

R is a rational term

→ all $\frac{\epsilon}{\epsilon}$ or IR origin cancel

R is of UV origin.

• in the $N=4$ amplitude

$$R = 0.$$

quark current conservation

$$\langle 11 \sigma^\mu 12 \rangle ?$$

$$\bar{u}_4 \gamma^\mu v_2$$

$$(0 \ 1 \ 1) \begin{pmatrix} 0 & \sigma^1 \\ \bar{\sigma}^1 & 0 \end{pmatrix} \begin{pmatrix} 0 \\ \langle 21 \rangle \end{pmatrix}$$

$$= (1 \ 1 \ 0 \ 0) \begin{pmatrix} 0 \\ \langle 21 \rangle \end{pmatrix} = 0$$

$$\bar{u}_+ \gamma^\mu v_2$$

$$= (1 \ 1 \ 0) \begin{pmatrix} 0 & \sigma^1 \\ \bar{\sigma}^1 & 0 \end{pmatrix} \begin{pmatrix} 0 \\ \langle 21 \rangle \end{pmatrix}$$

$$= (1 \ 1 \ 0 \ 1 \ 2)$$

A one-loop integral basis

In 4 dim ≤ 4 propagators
that are linearly independent.

But in $4-2\epsilon$ dim we can
find 1 more independent prop.

\Rightarrow pentagon integral would
be most complicated.

however we can arrange
such that in $d \rightarrow 4$ the
pentagon drops out i.e. is
 $O(\epsilon)$

[NB: external momenta fixed

in 4 dimensions]

Integral basis

$$I = \left\{ \begin{array}{c} \text{box} \\ \text{triangle} \\ \text{bubble} \end{array} \right\}$$

in a massless theory we don't include wave-function bubbles or tadpoles (scaleless)

$$\begin{array}{c} \text{bubble} \\ \text{tadpole} \end{array} \quad \text{in dim reg.}$$

Q: the double cut isolated a subset of the basis I
 \rightarrow many coefficient appear at the same time.

can I have just 1 coeff?

A: Yes, look at multiple cuts.

Generalised Unitarity

The connection with $SS^{\dagger} = 1$ is lost, but we can put more propagators on-shell and factorise into tree-level amplitudes.

old idea ('60s) but new insights (~ 2004) told us how to use complex momenta to define the cuts on-shell.

Let's look at the quadruple cut:

cut amplitude factorizes into trees evaluated at the solutions \underline{S} to

$$\{ \ell^2 = 0, (\ell - p_4)^2 = 0,$$

$$(\ell - p_4 - p_5)^2 = 0, (\ell + p_3)^2 = 0 \}$$

using a spinor basis we find 2 solutions:

$$l^\mu = a p_3^\mu + b p_4^\mu + \frac{c}{2} \langle 3 \bar{0}^\mu 4 \rangle + \frac{d}{2} \langle 4 \bar{0}^\mu 3 \rangle$$

fix a, b, c, d

$$(l + p_3)^2, (l - p_4)^2$$

$$\Rightarrow a = b = 0$$

$$l^2 = 0$$

$$\Rightarrow cd = 0$$

either $c = 0$ or $d = 0$

$$l^{(1)} \propto \langle 3 \bar{0}^\mu 4 \rangle$$

$$l^{(2)} \propto \langle 4 \bar{0}^\mu 3 \rangle$$

run through the evaluation
of the two cuts

$$\begin{array}{c}
 5^+ \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 2 \\ \circ \\ + \end{array} = + \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 1 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 2 \\ \circ \\ + \end{array} \\
 \begin{array}{c} 4^+ \\ \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 1 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 1 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 3 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 1 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 3 \\ \circ \\ + \end{array}
 \end{array}
 \quad \text{but}$$

$$(e^{(1)} - p_4)$$

$$\alpha < 5 \bar{0}^{14}$$

so this solution gives
zero.

on solution 2)

$$\begin{array}{c}
 + \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 1 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 3 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 1 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 3 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 1 \\ \circ \\ + \end{array} \\
 \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} 3 \\ \circ \\ + \end{array}
 \end{array}
 = -S_{34} S_{45}$$

$$\times A^{(6)}(1^- 2^- 3^+ 4^+ 5^+)$$

(can check)

value of box coeff.

$$c = \frac{1}{2} \left(\text{cut}(\ell^{(1)}) + \text{cut}(\ell^{(2)}) \right)$$
$$= -\frac{1}{2} S_{34} S_{45} A^{(6)}(1^- 2^- 3^+ 4^+ 5^+)$$

again this relates to the

IR pole structure.
