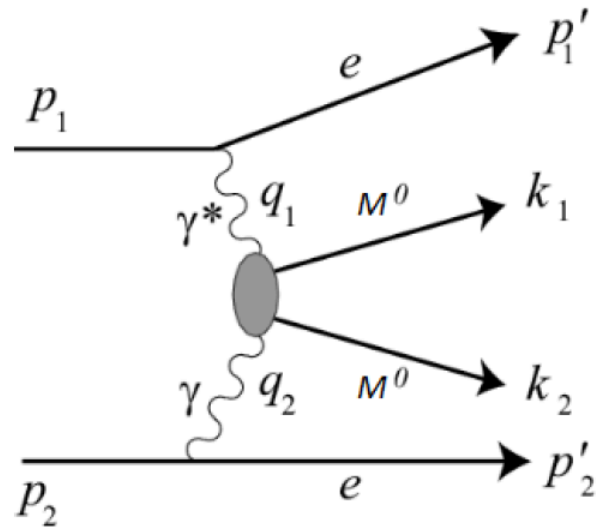
PWA10/ATHOS5 2018
16-20 July 2018, IHEP

Motivation of single-tag two-photon process

Reaction:

$e^+e^- \rightarrow e^\pm(\text{undected } e^\mp)$ hadrons



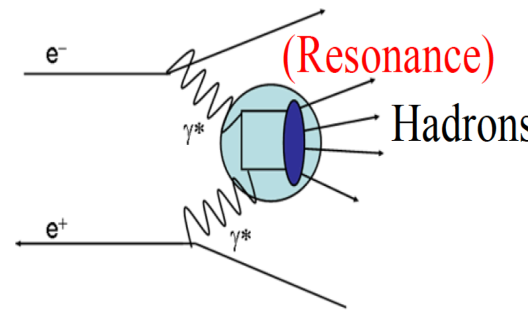
- Study strong interaction in low energy region, where pQCD can't be applied;

- Measure Q^2dependence of Transition Form Factor (TFF);

- Provide input for a data-driven estimate of the hadronic light-by-light contribution significant for the problem of muon g-2.

Motivation of no-tag two-photon process

- Lowest heavy-quakonium $\eta_c(1S)$, plus J/psi, η_b (1S) and $\Upsilon(1S)$, as benchmarks for the fine tuning of input parameters in QCD calculation.
- Attempt to measure $\Gamma_{\gamma\gamma}$ for $\eta_c(2S)$ and to address the discrepancy between data and QCD predictions.



Q = 0 , C = +

- Improved precision in both data and QCD predictions at higher W mass would provide more sensitive comparisons.
- pseudo-scalar meson pairs were measured by Belle [1]

  Charged-meson pairs： $\pi^+\pi^-$, K^+K^-. Neutral-meson pairs: $K^0_S K^0_S$， $\pi^0\pi^0$， $\eta\pi^0$， $\eta\eta$.

- pseudo-scalar tensor pair $\eta' f_2(1270)$ and three-body final state $\eta'\pi\pi$ would provide new information to validate QCD models.

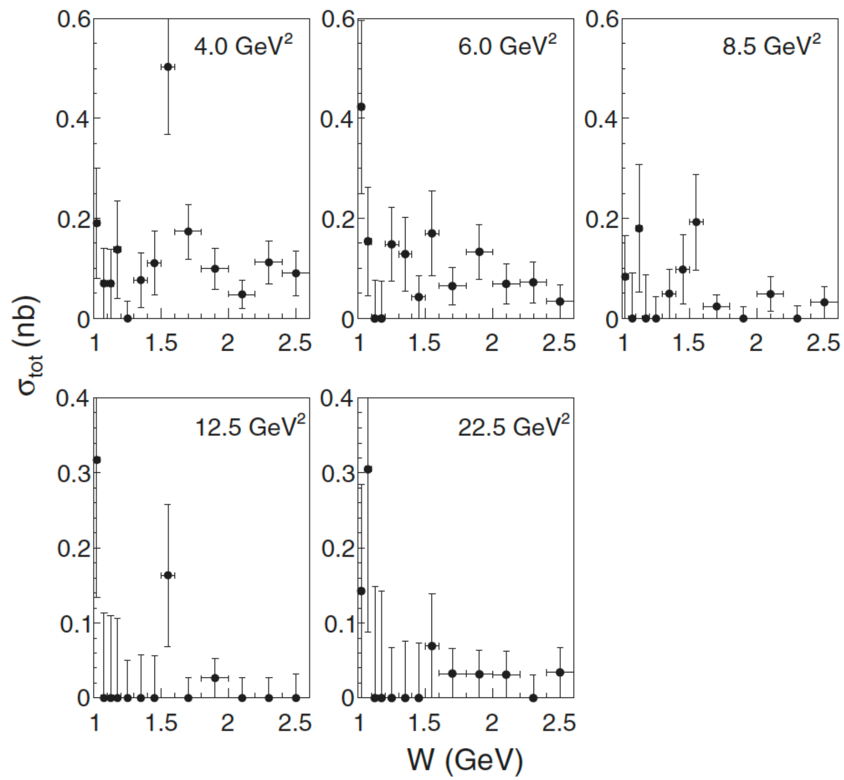
may be associated with $f_0(980)/a_0(980)$.

$$\sigma_{\rm tot}(\gamma^*\gamma \to K_S^0 K_S^0) = \frac{1}{2\frac{d^2L_{\gamma^*\gamma}}{dW\,dQ^2}} \frac{Y(W,Q^2)}{(1+\delta)\varepsilon(W,Q^2)\Delta W \Delta Q^2 \int \mathcal{L}dt\mathcal{B}^2}$$



Partial Wave Analysis for TFF of $f_2'(1525)$

Waves: S, D_0, D_1, and D_2, contribute (W<1.8 GeV)

PRD 97, 052003 (2018)

$$\frac{d\sigma(\gamma^*\gamma \to K_S^0 K_S^0)}{d\Omega} = \sum_{n=0}^{2} t_n \cos(n\varphi^*)$$

$$t_0 = |SY_0^0 + D_0 Y_2^0|^2 + |D_2 Y_2^2|^2 + 2\varepsilon_0 |D_1 Y_2^1|^2$$

$$t_1 = 2\varepsilon_1 \mathrm{Re}\left((D_2 |Y_2^2| - SY_0^0 - D_0 Y_2^0) D_1^* |Y_2^1|\right)$$

$$t_2 = -2\varepsilon_1 \mathrm{Re}\left(D_1^* |Y_2^1| (SY_0^0 + D_0 Y_2^0)\right)$$

$\varepsilon_0, \varepsilon_1$ are variables that depend on $x = \frac{q_1 \cdot q_2}{p_1 \cdot p_2}$

Spherical Harmonics

$$Y_0^0 = \sqrt{\frac{1}{4\pi}},$$

$$Y_2^0 = \sqrt{\frac{5}{16\pi}}(3\cos^2\theta^* - 1),$$

$$|Y_2^1| = \sqrt{\frac{15}{8\pi}}\sin\theta^*\cos\theta^*,$$

$$|Y_2^2| = \sqrt{\frac{15}{32\pi}}\sin^2\theta^*.$$

Parameterization of amplitudes

S and D_i amplitudes:

$$S = A_{BW} e^{i\phi_{BW}} + B_S e^{i\phi_{BS}},$$

$$D_i = \sqrt{r_{ifa}(Q^2)}(A_{f_2(1270)} - A_{a_2(1320)}) e^{i\phi_{faDi}} + \sqrt{r_{ifp}(Q^2)} A_{f_2'(1525)} e^{i\phi_{fpDi}} + B_{Di} e^{i\phi_{BDi}},$$

$r_{ifa}(Q^2)$ is fraction of $f_2'(1525)$ contribution in D wave.

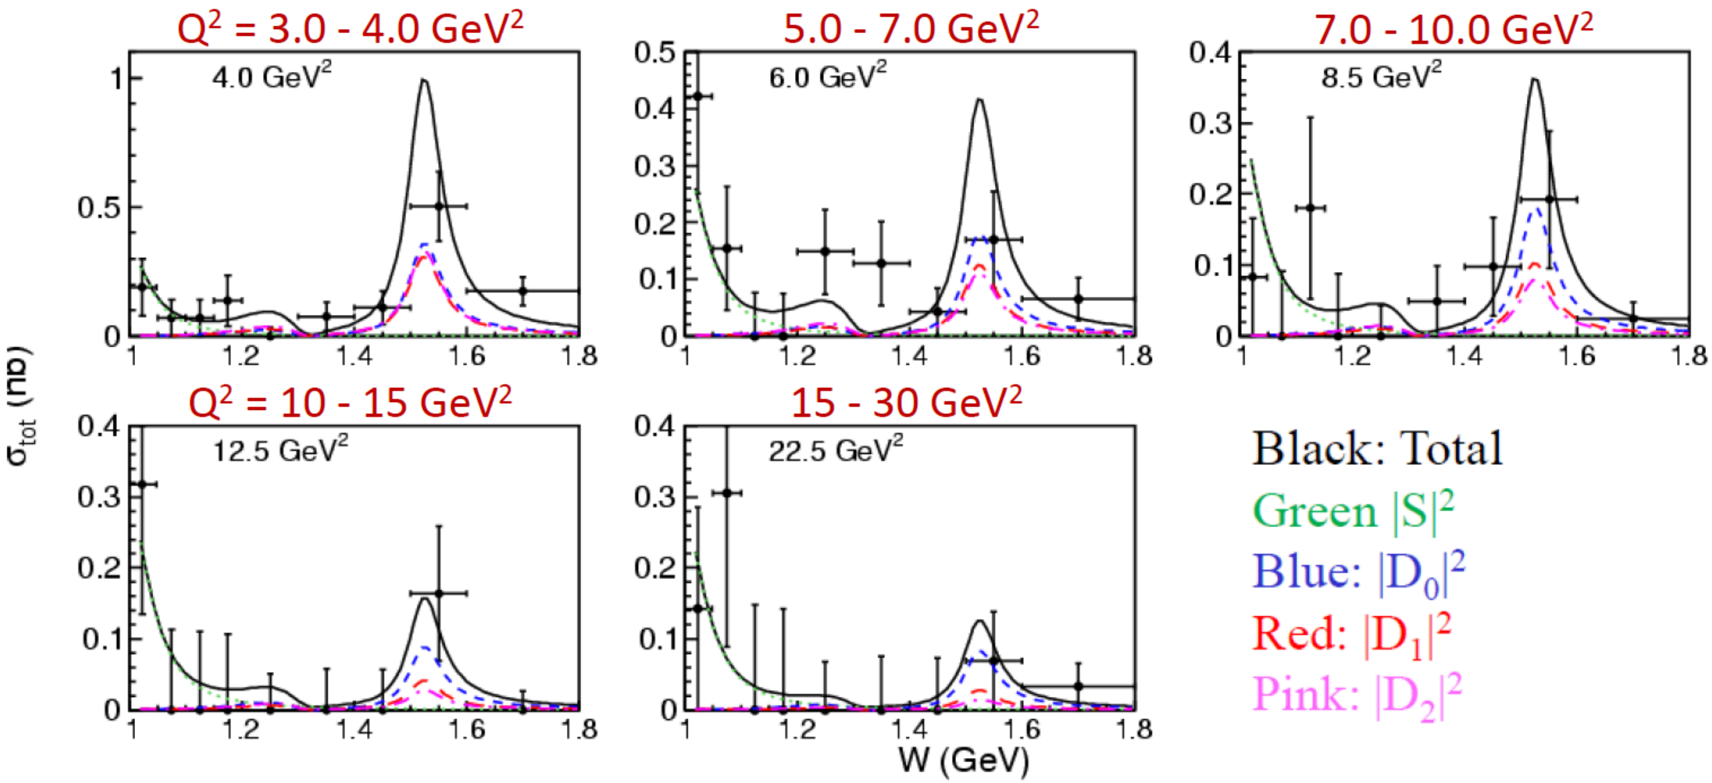
$$r_{0fp} + r_{1fp} + r_{2fp} = 1$$

Transition Form Factors

$$A_R^J(W) = F_R(Q^2)\sqrt{1 + \frac{Q^2}{m_R^2}}\sqrt{\frac{8\pi(2J+1)m_R}{W}} \times \frac{\sqrt{\Gamma_{\text{tot}}(W)\Gamma_{\gamma\gamma}(W)\mathcal{B}(K_S^0 K_S^0)}}{m_R^2 - W^2 - i m_R \Gamma_{\text{tot}}(W)},$$

$\gamma^*\gamma \to K_s^0 K_s^0$

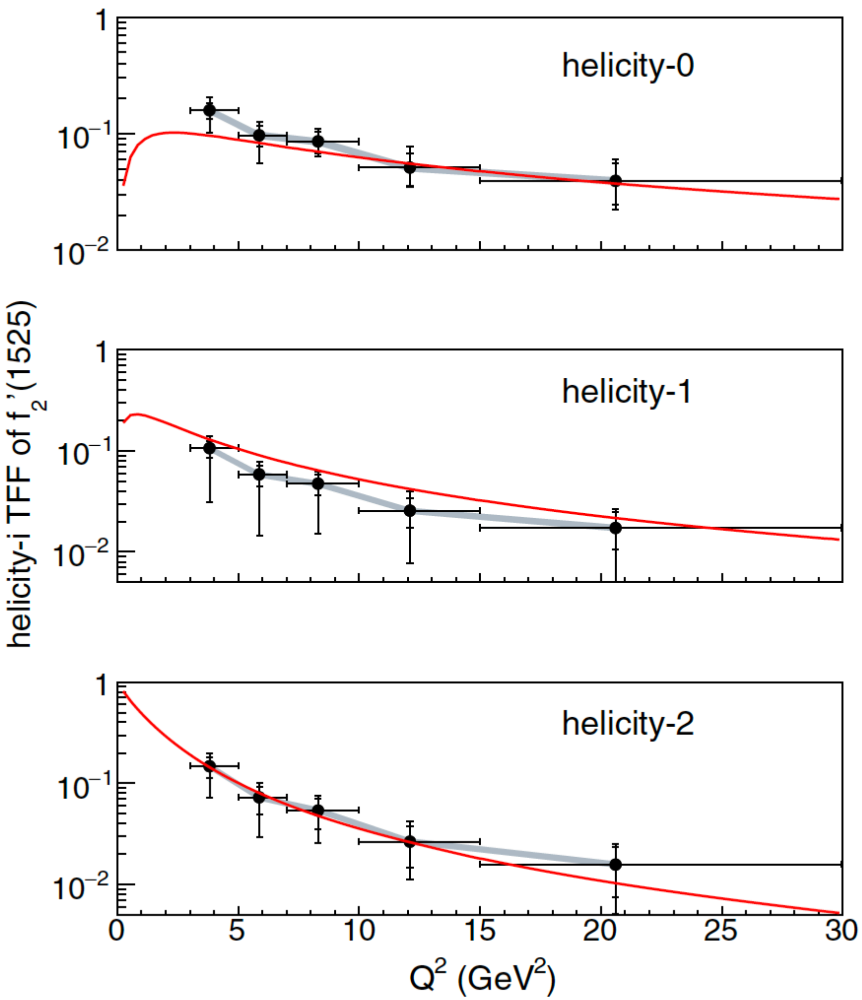
PWA results in W dependence at Q^2 bins



- Non-zero D_0 and D_1 components in the $f_2'(1525)$.
- No $f_2(1270)/a_2(1320)$ is seen.
- An enhancement near the threshold (0.995 GeV).

$\gamma^*\gamma \to K_s^0 K_s^0$

$f_2'(1525)$ TFF results



The obtained helicity-0, -1, and -2 TFF of the $f_2'(1525)$ meson as a function of Q^2.

Shorter error bars: statistical
Longer error bars: statistical and systematic
Shaded areas: overall systematic on $\Gamma_{\gamma\gamma}$.

— Schuler, Berends, van Glick (SBG)
Nucl. Phys. B 523, 423, (1998).

helicity-0 and -2 agree well with SBG.
helicity-1 -- slightly smaller, but not inconsistent.

$\gamma\gamma \rightarrow \eta'\pi^+\pi^-$

Simultaneous Fit for $\eta_c(1s)$ and $\eta_c(2s)$

	$\eta_c(1S)$		$\eta_c(2S)$	
	$\gamma\rho$	$\eta\pi^+\pi^-$	$\gamma\rho$	$\eta\pi^+\pi^-$
n_s	1728^{+69}_{-68}	945^{+38}_{-37}	65^{+14}_{-13}	41^{+9}_{-8}
M (MeV/c^2)	$2984.6 \pm 0.7 \pm 2.2$		$3635.1 \pm 3.7 \pm 2.9$	
Γ (MeV)	$30.8^{+2.3}_{-2.2} \pm 2.5$		11.3[fixed]	
$\Gamma_{\gamma\gamma}\mathcal{B}$ (eV)	$65.4 \pm 2.6 \pm 6.9$		$5.6^{+1.2}_{-1.1} \pm 1.1$	

Discussion on $\Gamma_{\gamma\gamma}$ of $\eta_c(2S)$

- Defining the ratio R = $\frac{\Gamma_{\gamma\gamma}(\eta_c(2S))B(\eta_c(2S))}{\Gamma_{\gamma\gamma}(\eta_c(1S))B(\eta_c(1S))}$, which is directly measured,

	This work	BaBar($K\bar{K}\pi$)[1]	CLEO[2]
R	$(8.6 \pm 2.6)\cdot 10^{-2}$	$(10.6 \pm 2.0)\cdot 10^{-2}$	$(18 \pm 5 \pm 2)\cdot 10^{-2}$

Consistent

so, we have $R_B = \frac{B(\eta_c(2S)\to\eta'\pi\pi)}{B(\eta_c(1S)\to\eta'\pi\pi)} \cong \frac{B(\eta_c(2S)\to K\bar{K}\pi)}{B(\eta_c(1S)\to K\bar{K}\pi)}$ within error.

- Assuming $R_B \cong 1$ [3] and
using the world average value $\Gamma_{\gamma\gamma}(\eta_c(1S)) = 5.1 \pm 0.4$ keV,
we obtain $\Gamma_{\gamma\gamma}(\eta_C(2S))$ = **0.44 ± 0.13** keV for $\eta'\pi\pi$ (this) and
0.54 ± 0.11 keV for BaBar($K\bar{K}\pi$) [1].
Both $\Gamma_{\gamma\gamma}(\eta_C(2S))$ values by Belle and BaBar are lower than
0.92 ± 0.28 keV from CLEO [2]

Discrepancy between data and QCD values

- QCD predictions for two-photon decay width of $\eta_c(2S)$ are ranged from 1.4 to 5.7.
- It is essential to have **precise measurement** of either $B(\eta_c(2S) \to K_s K\pi)$ or $B(B\to K\eta_c(2S))$

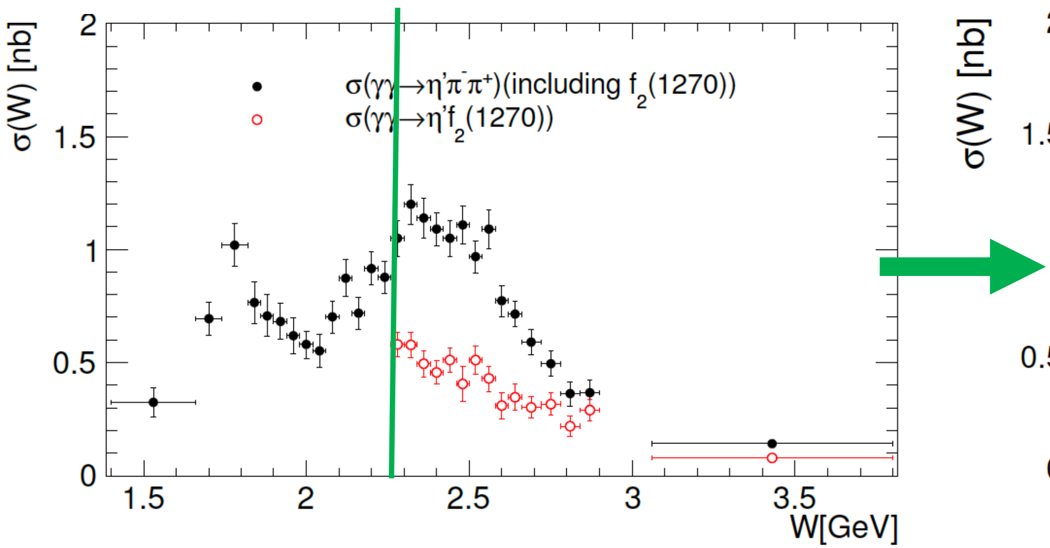
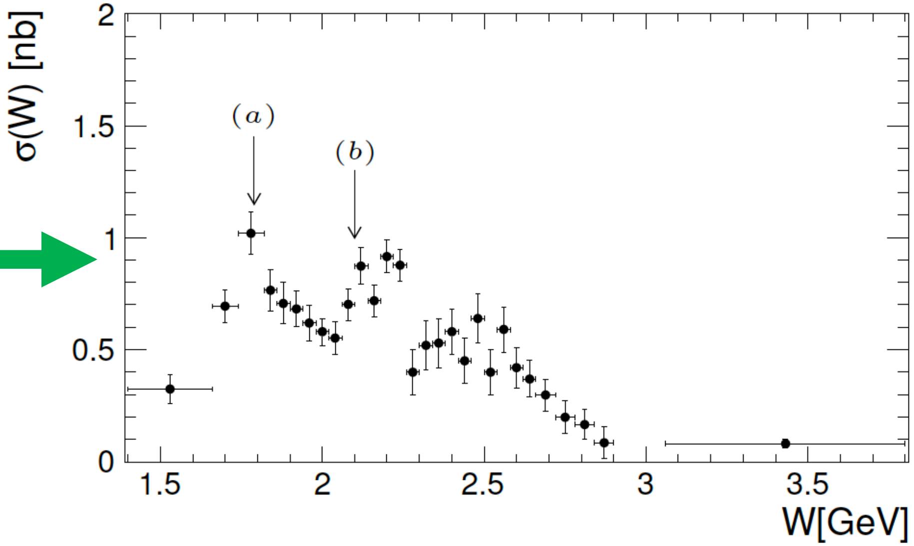
$\gamma\gamma \rightarrow \eta'\pi^+\pi^-$

Result of $\sigma(\gamma\gamma \rightarrow \eta'\pi\pi)$

η'f₂(1270) threshold



σ(γγ→η'ππ) after subtraction η'f₂(1270) contribution in W>2.26GeV region.



(a).Structure near 1.8 GeV/c^2 is contributed from X(1835) or η(1760) [1].

(b) Enhancement at 2.1GeV/c^2 is possible contribution from γγ→I(2100) → η'f_0(980).

[1]C.C. Zhang et al. Belle Collaboratin,Phys. Rev D86, 052002 (2012).

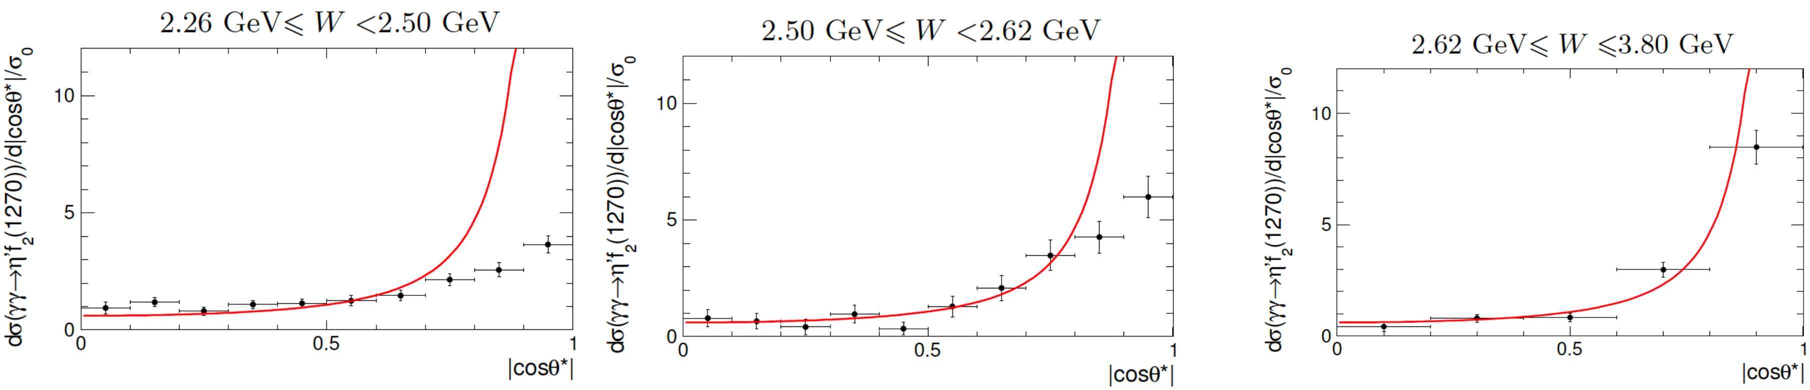
$\gamma\gamma \to \eta'\pi^+\pi^-$

Cross Section in |cosθ*|

- Black dots with error bar are the |cosθ*| dependent cross sections in data

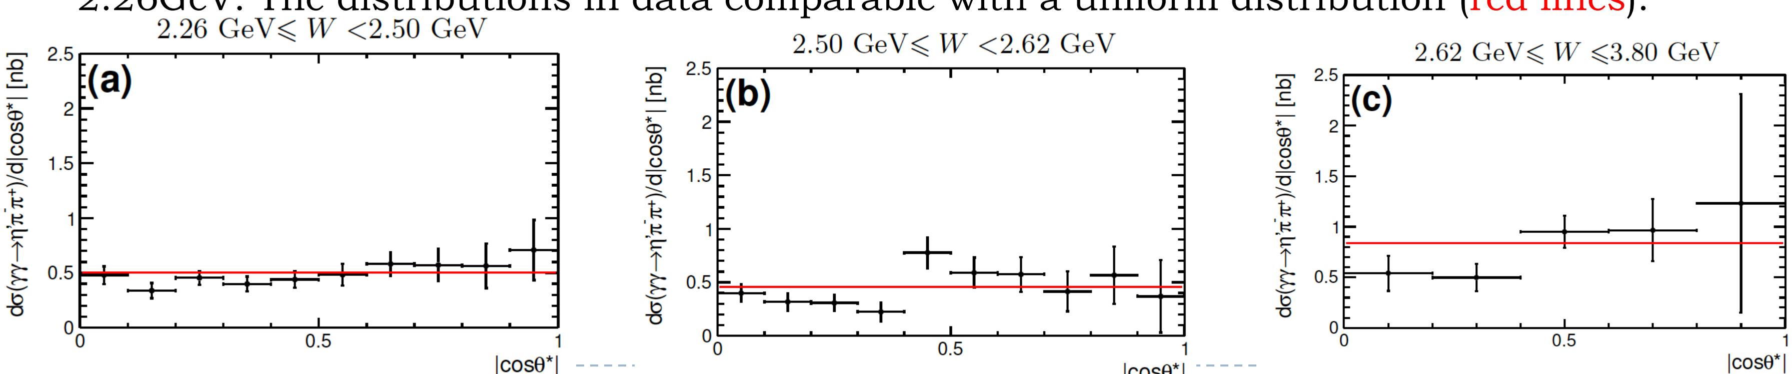
$\gamma\gamma \to \eta' f_2(1270)$

Red lines , normalized to the data, follows a $1/\sin^4\theta$ behavior.



$\gamma\gamma \to \eta'\pi\pi$

Measured cross section after subtracting the $\gamma\gamma \to \eta' f_2(1270)$ contribution in W region above 2.26GeV. The distributions in data comparable with a uniform distribution (red lines).



Summary

Single-tag two-photon results

- Cross section for $\gamma^*\gamma \rightarrow K_S^0 K_S^0$ has been measured for $2M(K_S^0) < W < 2.6$ GeV, 3 GeV$^2 < Q^2 <$ 30 GeV^2
- Q^2 dependence of $\Gamma_{\gamma^*\gamma}$ of $\boldsymbol{\chi_{c0}}$ and $\boldsymbol{\chi_{c2}}$ has been measured.
- Q^2 dependence of $f_2'(1525)$ TFF has been measured.
- First measurement for $\gamma^*\gamma \rightarrow \boldsymbol{\pi^0\pi^0}$ with Q^2 up to 30 GeV^2.
- Q^2 dependence of f_2 (1270) TFF has been measured

No-tag two-photon results

- First observation of $\eta_C(2S) \rightarrow \eta'\pi\pi$ with a significance 5.5σ including systematic error.
- First observation of $\eta_c(1S) \rightarrow \eta' f_0(2080)$ decay with $f_0(2080) \rightarrow \pi^+\pi^-$ with a significance 20σ
- Measurements of pseudo-scalar tensor pair $\eta' f_2(1270)$ production, as well as that of $\eta'\pi\pi$, are made for the first time.

Determine each component and the relative phase by a fit

From Uehara-san's DIS 2018 report

Angular dependence and the PWA fit

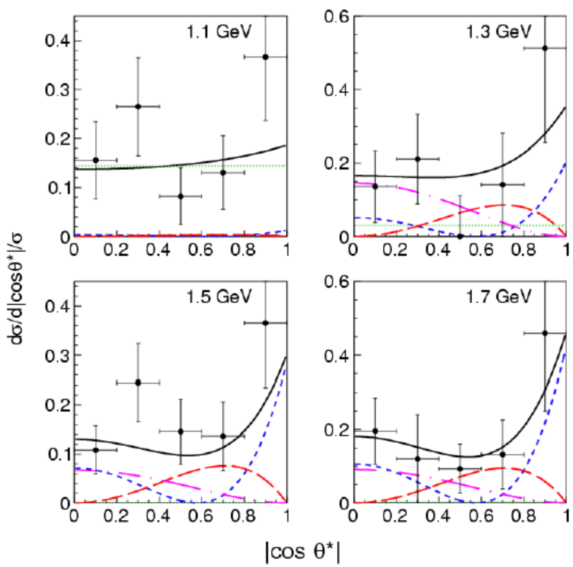
Due to a lack of statistics, we use Q^2-integrated angular differential cross section derived with the following convention (MC generated isotropically)

$$d^2\sigma/d|\cos\theta^*|d|\varphi^*| \propto N_{\mathrm{EXP}}(|\cos\theta^*|, |\varphi^*|)/N_{\mathrm{MC}}(|\cos\theta^*|, |\varphi^*|)$$

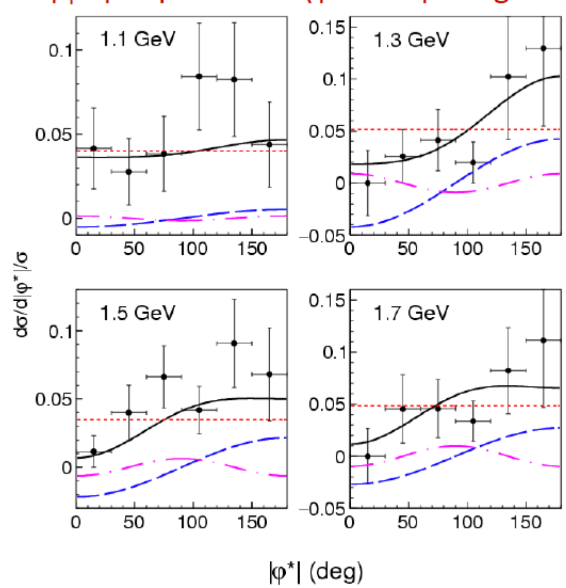
Q^2: integrated over the full range between 3 and 30 GeV^2

W: 4 bins

|cos θ*| dependence (|φ*| integrated)



|φ*| dependence (|cos θ*| integrated)



We regard this as the angular dependence at $\langle Q^2 \rangle = 6.5\ \mathrm{GeV}^2$

Fit:

Black: total

Red: t_0

Blue: $t_1 \cos\varphi^*$

Magenta: $t_2 \cos 2\varphi^*$

The fit is applied to the two-dimensional angular-dependence data.

Forward enhancement is from the helicity-0 component.

From PDG 2017

	Branching fraction
$\eta_c(1S) \rightarrow K\bar{K}\pi$	$(7.3 \pm 0.5)\%$
