Introduction

Leptonic and hadronic decays of charmed hadrons (D^0 , D^+ , D_s^+ and Λ_c^+) provide ideal test-beds to explore weak and strong effects

➤ D leptonic decays

$f_{D(s)+}$, $f_{K(\pi)+}(0)$: better calibrate LQCD

$|V_{cs(d)}|$: better test on CKM matrix unitarity

Search for lepton flavor violation

➤ D hadronic decays

$D^0\bar{D}^0$ mixing parameters and CPV

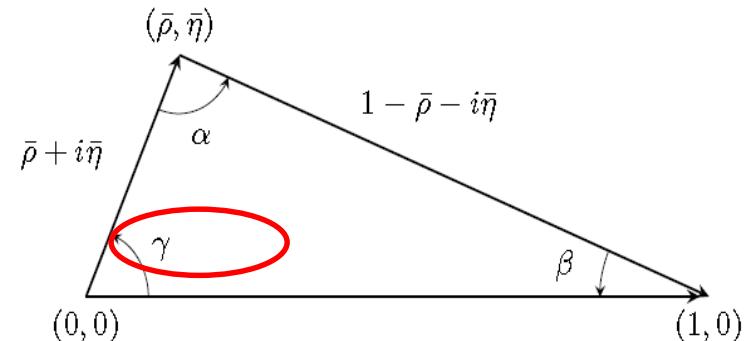

Strong phase difference in D^0 decays:

Constrain γ/ϕ_3 measurement in B decays

➤ Absolute BFs of Λ_c^+ decays

No absolute BF measurements of Λ_c^+ using near threshold data before BESIII

- Flavor eigenstate ($|D^0\rangle, |\bar{D}^0\rangle$) \neq mass eigenstate $|D_{1,2}\rangle$ with $M_{1,2}$ and $\Gamma_{1,2}$

$$|D_{1,2}\rangle \equiv p|D^0\rangle \pm q|\bar{D}^0\rangle \text{ (CPT: } p^2+q^2=1)$$

- Mixing parameters definition:

$$x \equiv \frac{M_1 - M_2}{\Gamma}, \quad y \equiv \frac{\Gamma_1 - \Gamma_2}{2\Gamma}, \quad \Gamma \equiv \frac{\Gamma_1 + \Gamma_2}{2}$$

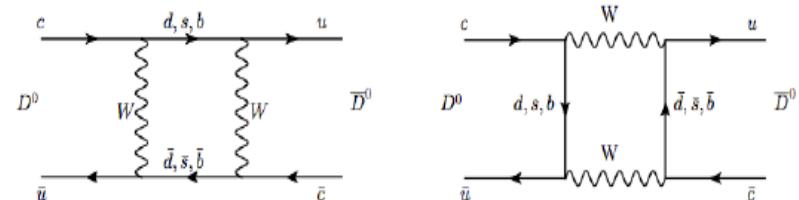

- under phase convention

$$CP|D^0\rangle = |\bar{D}^0\rangle, CP|\bar{D}^0\rangle = |D^0\rangle,$$

- with CP conservation ($q = p = 1/\sqrt{2}$):

$$|D_{1,2}\rangle = |D_{+-}\rangle \text{ (CP eigenstates)}$$

$D^0\bar{D}^0$ mixing and CPV

$D^0\bar{D}^0$ mixing is observed, no direct CPV is found

Strong phase: bridge to constrain γ/ϕ_3

■ Quantum correlated $D^0\bar{D}^0$ decays in $\psi(3770)$:

- CP asymmetry in mixing and decays
- Interference → strong phase parameters → Constrain γ/ϕ_3 , which is important for CKM UT

Direct measurement

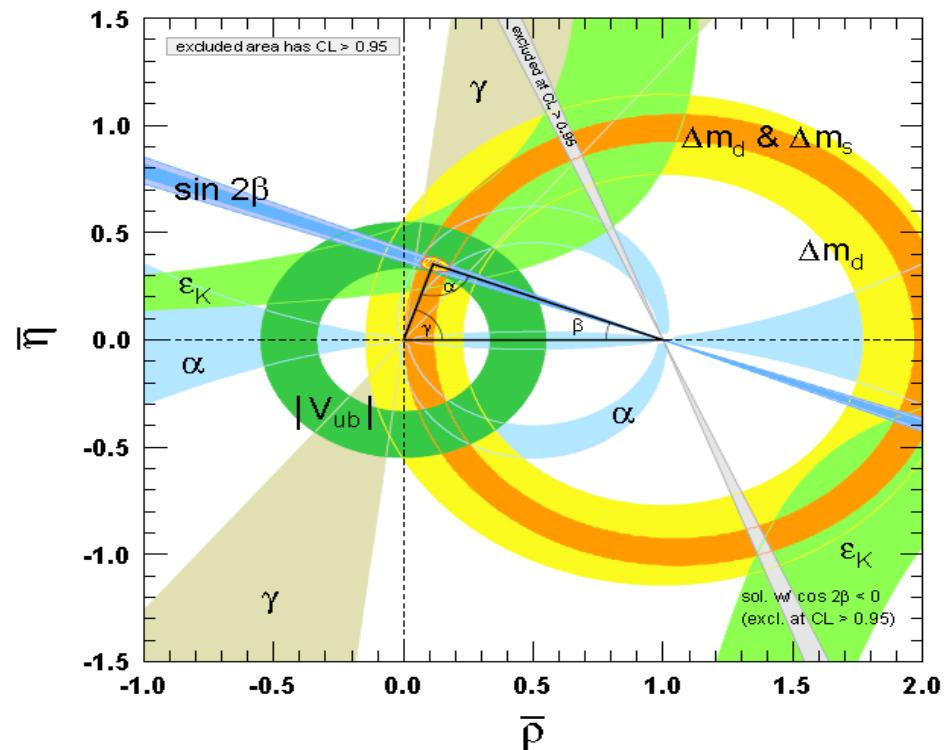

$$\alpha/\phi_2 = (85.4^{+4.0}_{-3.9})^\circ$$

$$\beta/\phi_1 = (21.38^{+0.79}_{-0.77})^\circ$$

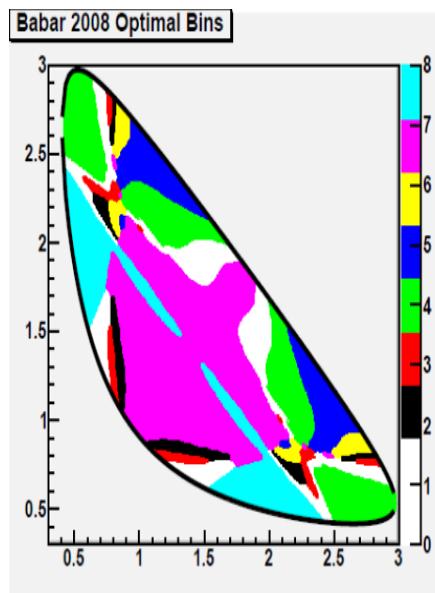

$$\gamma/\phi_3 = (68^{+8.0}_{-8.5})^\circ$$

γ is the worst measured angle,
mostly due to systematic error

Significant deviation from UT will
imply NP beyond SM

Upgrade	~ 1
Future upgrade	<0.5

- Current one syst. $\sim 2^\circ$ from CLEO strong phase measurements
- 15-20 fb^{-1} $\psi(3370)$ data from BESIII are desired to avoid syst. limitation for upgrade scenario

More 15 fb^{-1} $\psi(3770)$ data@BESIII will avoid syst. limitation for γ/ϕ_3 measurement

SU(3) symmetries and breaking effect

- Ratio of branching fractions of D to KK and pi pi

$$R = \frac{Br(D^0 \rightarrow K^+ K^-)}{Br(D^0 \rightarrow \pi^+ \pi^-)} \approx 2.8$$

- R=1 in the SU(3) flavour symmetry limit
- Branching fraction of $\mathcal{B}(D^0 \rightarrow K^0 \bar{K}^0) = (0.320 \pm 0.038) \times 10^{-3}$ vanishes in the SU(3) limit
- D⁰bar mixing parameters
 - $x, y \sim \sin^2 \theta_C \times [SU(3) \text{ breaking}]^2$
 - Non-zero mixing parameters indicate large SU(3) breaking effect

Under the isospin symmetry, its amplitude is related to those of the most favored proton modes $\Lambda_c^+ \rightarrow p\bar{K}^-\pi^+$ and $\Lambda_c^+ \rightarrow p\bar{K}^0\pi^0$ as $\mathcal{A}(n\bar{K}^0\pi^+) + \mathcal{A}(p\bar{K}^-\pi^+) + \sqrt{2}\mathcal{A}(p\bar{K}^0\pi^0) = 0$. [2,3]. In the three-body Λ_c^+ decay to $N\bar{K}\pi$, the total decay amplitudes can be decomposed into two isospin amplitudes of the $N\bar{K}$ system as isosinglet ($I^{(0)}$) and isospin-one ($I^{(1)}$). In the factorization limit, the color-allowed tree diagram, in which the π^+ is emitted and the $N\bar{K}$ is an isosinglet, dominates $I^{(0)}$, and $I^{(1)}$ is expected to be small compared to $I^{(0)}$ as it can only proceed through the color-suppressed tree diagrams. Preliminary results :

$$B[\Lambda_c^+ \rightarrow \Sigma^- \pi^+ \pi^+] = (1.81 \pm 0.17 \pm 0.09)\%$$

$$B[\Lambda_c^+ \rightarrow \Sigma^- \pi^+ \pi^+ \pi^0] = (2.11 \pm 0.33 \pm 0.14)\% \quad [\text{First observation}]$$

The previous one is consistent with and more precise than the PDG value of $[\Lambda_c^+ \rightarrow \Sigma^- \pi^+ \pi^+] = (2.3 \pm 0.4)\%$.

Larger threshold Λ_c^+ data at BESIII

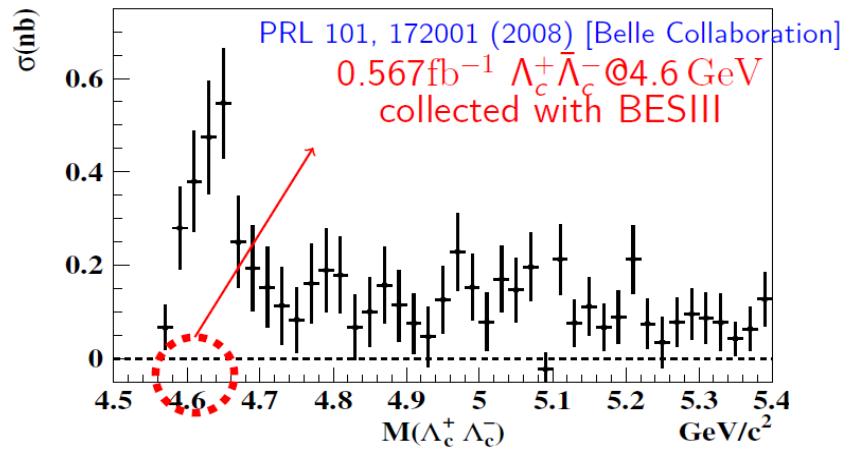

国际粲重子 Λ_c^+ 衰变实验研究的里程碑：**BESIII**开辟使用近阈数据绝对测量 Λ_c^+ 衰变的新领域

The screenshot shows the CERN COURIER website. At the top, there is a logo for the Institute of High Energy Physics, Chinese Academy of Science, and a section for "Senior Research Positions". Below the header, there is a search bar and links for "Latest Issue", "Archive", "Jobs", "Links", "Buyer's guide", "White papers", "Events", and "Contact us". A yellow sidebar on the left encourages users to "REGISTER NOW" and provides information about becoming a member of cerncourier.com. The main content area features a news article titled "BESIII makes first direct measurement of the Λ_c at threshold" dated Mar 18, 2016. The article includes a plot of the beam-constrained mass distribution for $\Lambda_c^+ \rightarrow p K^+$ at threshold. To the right of the article, there are sections for "DIGITAL EDITION" (with a link to the digital edition) and "KEY SUPPLIERS" featuring logos for JANIS Cryogenic Systems and Linde.

Summary

- $D^0(+)$ 研究取得一些重要物理成果

- D^+ 衰变常数 f_{D^+}

- 形状因子 $f_{D \rightarrow K(\pi)}(q^2)$

- CKM矩阵元 $|V_{cs(d)}|$

- $D^0\bar{D}^0$ 混合参数 $y_{CP}, \delta_{K\pi}$

- $D^0 \rightarrow K_S \pi^+ \pi^-$ 强相差初步结果

→精密检验格点QCD计算
和CKM矩阵幺正性、探讨
 $D^0\bar{D}^0$ 混合、约束 γ/ϕ_3 测量

- Λ_c^+ 衰变的系统研究结束了其发现近40年来无近阈数据绝对测量的历史

- 2016年，在4.178 GeV采集了 3.2 fb^{-1} D_s^+ 数据。已取得 D_s^+ 衰变常数 f_{Ds+} 、CKM矩阵元 $|V_{cs}|$ 等初步结果

- 更多物理结果将在未来1–2年完成

quoted from Derrick's talk given at APS2014

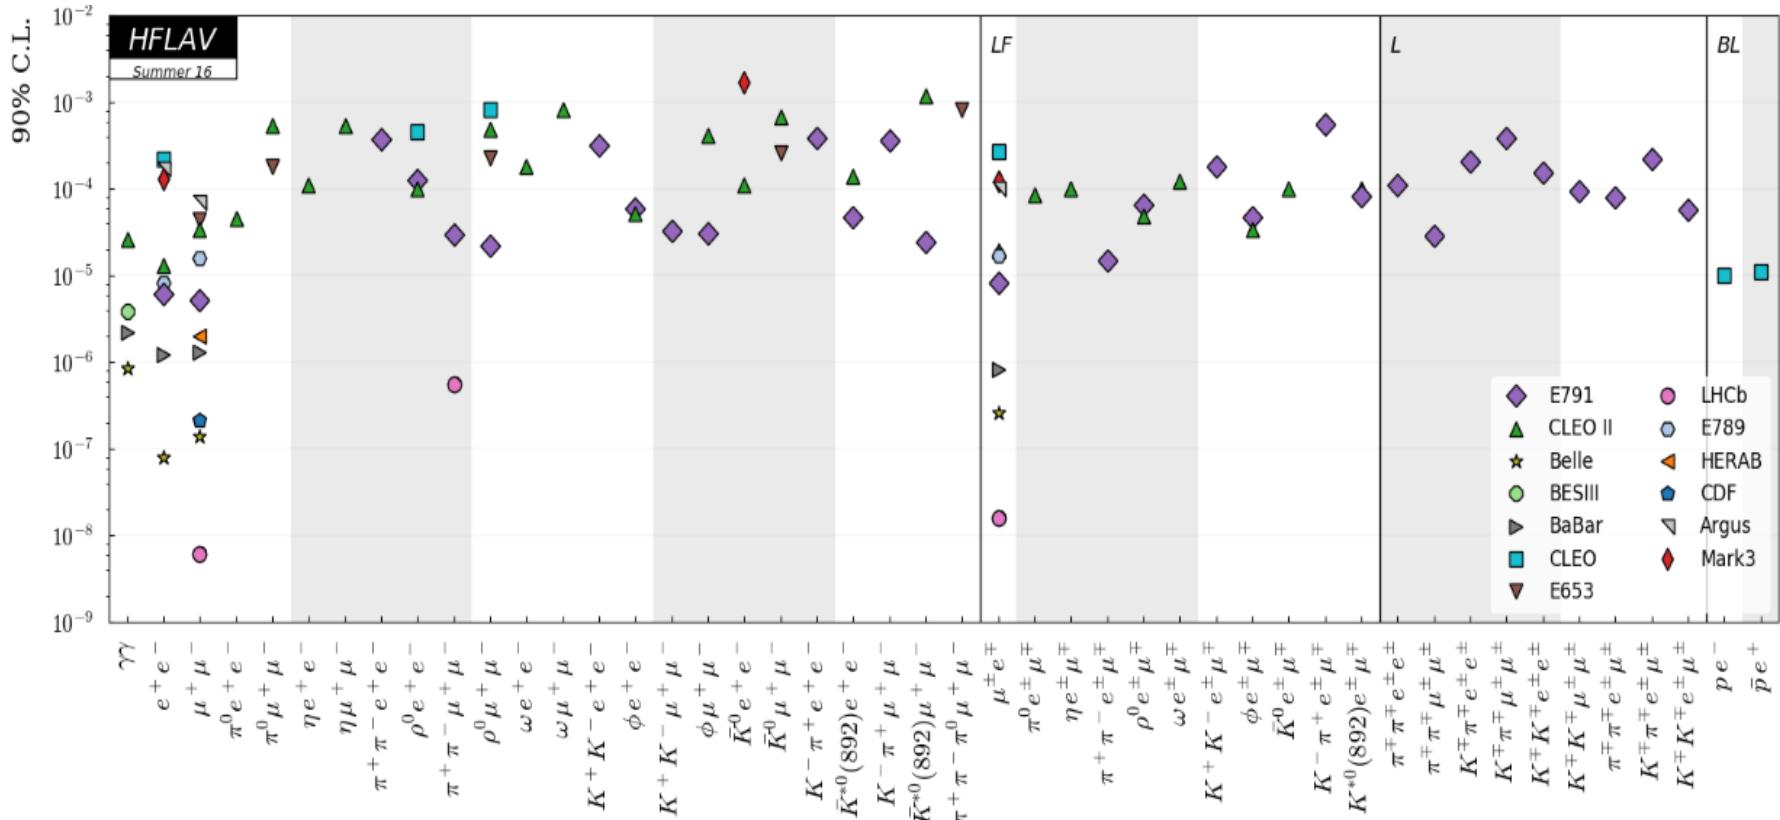

The $\mathcal{B}(D^0 \rightarrow K^-\pi^+)$ has been corrected by the PDG value of $\mathcal{B}(D^0 \rightarrow K^+\pi^-)$.

For $D^0 \rightarrow K_S^0\eta$, $D^+ \rightarrow \pi^0\pi^+$, $D^+ \rightarrow \eta\pi^+$, $D^+ \rightarrow \eta'\pi^+$, $D^+ \rightarrow K_S^0\pi^+$ and $D^+ \rightarrow K_S^0K^+$, it shows better precision than the present values.

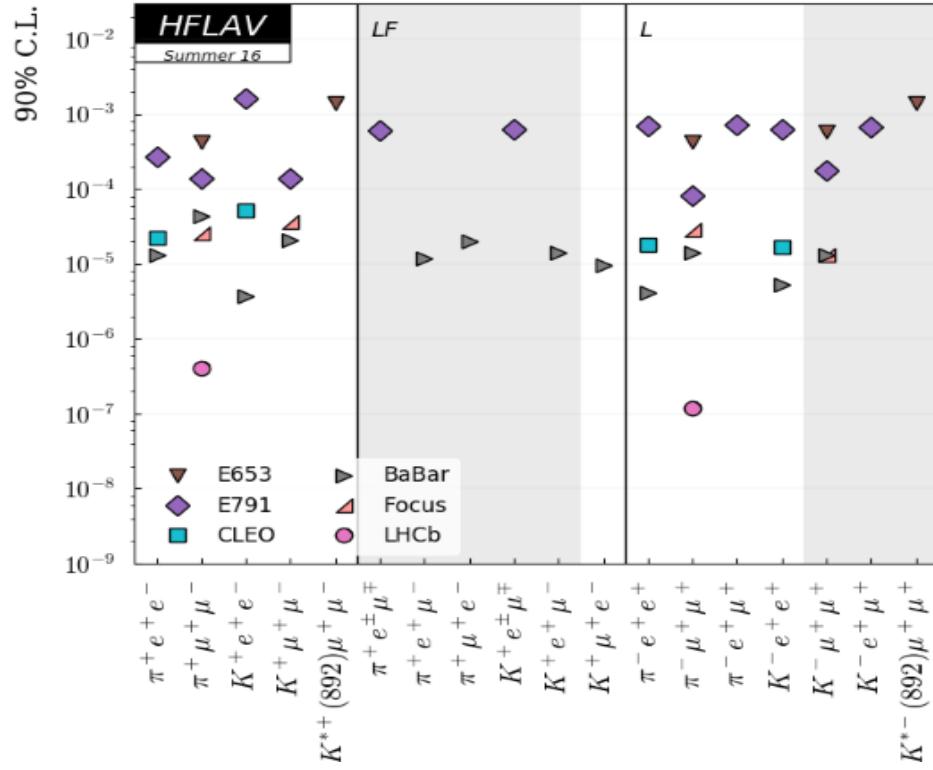

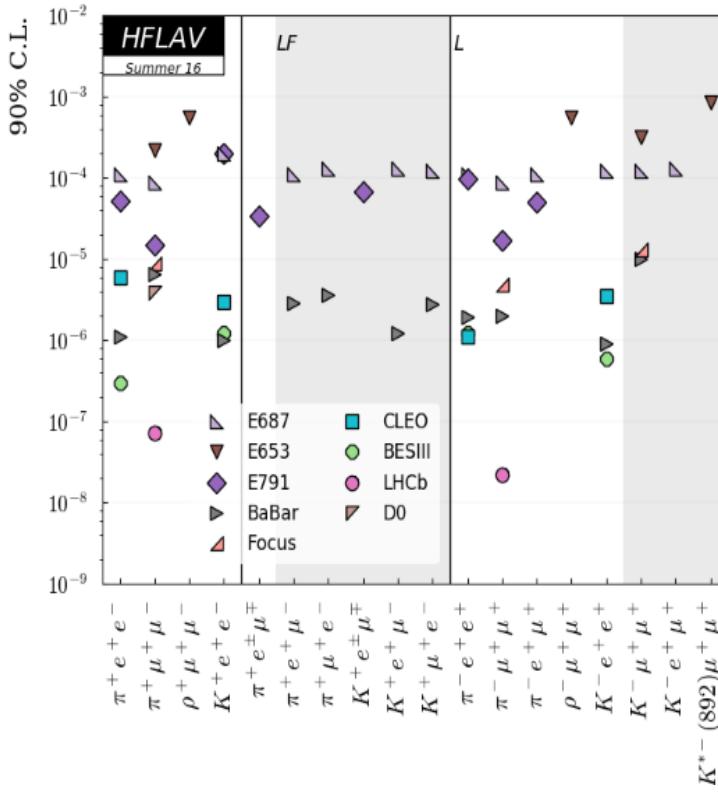

- ◆ The study of the hadronic decays of charmed D mesons is of great significance in the study of the strong and weak interactions in D decays.
- ◆ The analysis on $D \rightarrow PP$ modes will provide materials for the study of SU(3) breaking effect¹. And the observation of CP violation in D decay is commonly believed to be indications of new physics.
- ◆ $D^0 \rightarrow K^-\pi^+$ is an important normalization mode.
- ◆ Most of the D decays have been studied by CLEO in 2010², other measurements come from Belle³, BaBar⁴ and CDF⁵, etc.
- ◆ Some of the branching fractions (BFs) are not well established. With the 2.93 fb^{-1} data taken at 3.773 GeV within BESIII, the results will help to improve these measurements.
