- Higgs boson observed, SM is complete. SM fits the experimental data very well
 → big success in **EW scale**

The Nobel Prize in Physics 2013
 François Englert, Peter Higgs

P. Higgs at CMS

Very happy faces after the announcement of the discovery on 4th July 2012 at CERN and at ICHEP Melbourne

Announced on 8th October and celebrated on 10th December 2013:

2013 NOBEL PRIZE IN PHYSICS

François Englert
Peter W. Higgs

© © The Nobel Foundation, Photo: Lovisa Engblom.

“for the theoretical discovery of a mechanism that contributes to our understanding of the origin of mass of subatomic particles, and which recently was confirmed through the discovery of the predicted fundamental particle, by the ATLAS and CMS experiments at CERN’s Large Hadron Collider”

Standard Model of Elementary Particles

mass →	$\approx 2.3 \text{ MeV}/c^2$	$\approx 1.275 \text{ GeV}/c^2$	$\approx 173.07 \text{ GeV}/c^2$	0	$\approx 126 \text{ GeV}/c^2$
charge →	2/3	2/3	2/3	0	0
spin →	1/2	1/2	1/2	1	0
	u up	c charm	t top	g gluon	H Higgs boson
QUARKS	$\approx 4.8 \text{ MeV}/c^2$	$\approx 95 \text{ MeV}/c^2$	$\approx 4.18 \text{ GeV}/c^2$	0	
	-1/3	-1/3	-1/3	0	
	1/2	1/2	1/2	1	
	d down	s strange	b bottom	γ photon	
	$0.511 \text{ MeV}/c^2$	$105.7 \text{ MeV}/c^2$	$1.777 \text{ GeV}/c^2$	$91.2 \text{ GeV}/c^2$	
	-1	-1	-1	0	
	1/2	1/2	1/2	1	
	e electron	μ muon	τ tau	Z Z boson	
LEPTONS	$< 2.2 \text{ eV}/c^2$	$< 0.17 \text{ MeV}/c^2$	$< 15.5 \text{ MeV}/c^2$	$80.4 \text{ GeV}/c^2$	
	0	0	0	± 1	
	1/2	1/2	1/2	1	
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson	
				GAUGE BOSONS	

The elementary particles arranged according to their properties

Three families of quarks and leptons

← **Fermionen** → ← **Bosonen** →

- Need a more **fundamental theory** of which SM is only a low-energy approximation → **New Physics**

- While has problem in **Planck scale**:
 - Naturalness and “hierarchy” problem
 - Unification of gauge coupling
 - Dark Matter
 -

Unfortunately, there is a problem with the Higgs!

Peter Higgs

The joy in the ATLAS Control Room when the first LHC beam collided on November 23rd, 2009....

A well-deserved toast to all who have built such a marvelous machine, and to all who operate it so superbly (first 7 TeV collisions on 30th March 2010)

The results are based on $36-80 \text{ fb}^{-1}$ @ 13 TeV (RUN2 2015-2017) ~ 2-3% of total

We are here :
 2015-2017: $\sim 80 \text{ fb}^{-1}$ (13TeV)
 2015 $\sim 3 \text{ fb}^{-1}$
 2016 $\sim 33 \text{ fb}^{-1}$
 2017 $\sim 50 \text{ fb}^{-1}$

High-luminosity LHC

Run3
 2021-2023

14TeV

$\mathcal{L} \sim 300 \text{ fb}^{-1}$
 $\langle PU \rangle \approx 50$

$\mathcal{L} \sim 3000 \text{ fb}^{-1}$
 $\langle PU \rangle \approx 140$

LS3

Run4-5 ...
 2027-2037

Run2
 2015-2018

13TeV

$\mathcal{L} \sim 150 \text{ fb}^{-1}$
 $\langle PU \rangle \approx 25$

LS2

2024-2026

2019-2020

LS1

2013-2014

Long Stop

Run1

8TeV

2010-2012
 $\sim 25 \text{ fb}^{-1}$

New Physics beyond the SM

SUSY

SUSY search at colliders (mainly at LHC)

What is SUSY?

How SUSY do help?

(TeV-scale) Supersymmetry (SUSY)

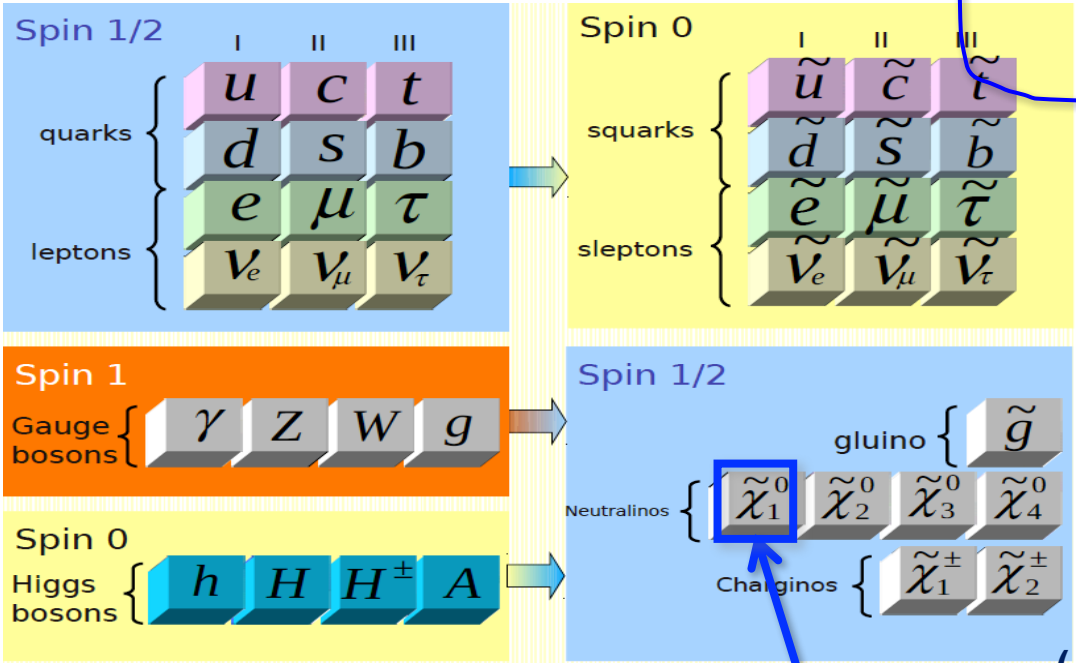

P. Higgs at CMS

SUSY Introduction

OUR WORLD...

NEW WORLD?

Julius Wess
(1934 – 2007)

Bruno Zumino
(1923 – 2014)

(Julius Wess and Bruno Zumino, 1974)

Establishes a symmetry between fermions (matter) and bosons (forces)

Motivation:

- Unification (fermions-bosons, matter-forces)
- Solves some deep problems of the SM
- Provide Dark Matter candidate
-

$$Q |\text{boson}\rangle = |\text{fermion}\rangle$$

$$Q |\text{fermion}\rangle = |\text{boson}\rangle$$

Spin differ by 1/2 ³⁰

SUSY Introduction

- **Solve hierarchy problem** without “fine tuning”
 - Fermion and boson loops contribute with **different signs** to the Higgs radiative corrections
 - Supersymmetric partner contributions to Higgs mass **cancel** SM contributions

$$M_h^2 = M_{h,tree}^2 + \Delta M_h^2; \quad SM : \Delta M_h^2 \sim \Lambda^2; \quad SUSY : \Delta M_h^2 \sim m_{soft}^2 \log(\Lambda / m_{soft})$$

SUSY Introduction

□ Unification of gauge couplings

- New particle content changes running of couplings
- requires SUSY masses below few TeV

Provide Dark Matter candidate

天文学家发现宇宙中很大一部分是我们看不见的暗物质（明物质只占4.6%）

● Provide perfect dark matter candidate - **WIMP** (lightest neutralino in R-parity conserving models)

- stable
- electrically neutral
- same density as DM

$$0.094 < \Omega_{\text{CDM}} h^2 < 0.136 \quad (95\% \text{ CL})$$

→ 通过寻找SUSY，可以为暗物质寻找提供实验证据！

‘Supersymmetric’ particles ?

How to hunt SUSY?

(TeV-scale) Supersymmetry (SUSY)

How do we start? - SUSY Signature

- **Conserved R parity** (originally introduced for stability of proton)

$$R = (-1)^{3(B-L)+2S}$$

R=+1 (SM)
R=-1 (SUSY)

- SUSY particles produced/annihilated in pairs
- Lightest SUSY particle (LSP) stable (DM candidate)
- Typical signature: jets/leptons/photons + MET (key signature: large MET)

$\tilde{\chi}_{1,2,3,4}^0$
Neutralinos
 $\tilde{\chi}_{1,2}^\pm$
Charginos

How do we search for SUSY?

2010

- Not like general particles with peak in mass spectrum ☹️

How do we search for SUSY?

How do we search for SUSY?

- **SUSY search strategy:** search for deviation from SM from the tails
- **SUSY sensitive variables:** Try to establish excess of events in some sensitive kinematic distribution
- **SM background:** the discovery of new physics can only be claimed when SM backgrounds are understood well or under control
 - SM bgs understood very well 😊
 - No hints for new physics ☹️
 - Slightly overshoot in WW cross section, but consistent with NNLO xsec.

SM “backgrounds”– the big picture

SUSY Sensitive Variables

E_T^{miss}

m_T

M_{eff}

m_{T2}

- E_T^{miss} from escaping LSP, to suppress bg from mis-measured jets and oth. SM BG
- Related to the sparticle mass scale, like effective mass (M_{eff})

$$M_{\text{eff}} \equiv \sum_{i=1}^{N_{\text{jets}}} p_T^{\text{jet},i} + \sum_{j=1}^{N_{\text{lep}}} p_T^{\text{lep},j} + E_T^{\text{miss}}$$

- m_T , m_{T2} (stransverse mass): suppress BG with W_s

$$m_{T2} = \min_{\mathbf{q}_T} \left[\max \left(m_T(\mathbf{p}_T^{\ell 1}, \mathbf{q}_T), m_T(\mathbf{p}_T^{\ell 2}, \mathbf{p}_T^{\text{miss}} - \mathbf{q}_T) \right) \right]$$

- Many others ...

How do we search for SUSY?

-Analysis Procedure (**similar for exotics**)

1. **Be aware of SUSY signature, design signal grid**
2. **Pre-selection**: select good objects (e, mu, tau, jet, ...), apply trigger depending on analysis, remove bad events (bad runs, not from pp collisions, in transition region ...)
3. **SR definition and optimization**
 - **Define signal regions** based on decay topologies occurring in generic models
 - **Set final cut** on **discriminating variables** (e.g. M_{eff}) to optimize sensitivity to reference models with appropriate mass scale
4. **SM Background estimations (data-driven + MC)**
5. **Compare SM predictions with data**
6. **If no excess, interpret results in different SUSY models**

1. Be aware of SUSY signature, design signal grid

W → l nu
→ qq

Final states:
 ≥ 1 lepton + multi-jets + large E_T^{miss}

2: Pre-selection Reconstructed Objects

- **Photons:** no track but energy in el-m (and not in the hadronic) calorimeter
- **Electrons:** track and energy in el-m (and not in the hadronic) calorimeter
- **Muons:** track in inner tracker and muon chamber
- **Jets:** cluster in hadronic calorimeter

MET: Missing Transverse Energy

- At the LHC an unknown proportion of the energy of the colliding protons escapes down the beam-pipe
- Invisible particles (neutrinos, neutralinos?) are created their momentum can be constrained in **the plane transverse to the beam direction**

$$E_T^{\text{miss}} = - \sum_i p_T(i)$$

Triggering on Physics

- Apply trigger depending on analysis
- Only pick up what we are interested events
- MissingET trigger used here

Final states: ≥ 1 lepton + multi-jets + large E_T^{miss}

3: SR definition and optimization

arXiv:1605.04285

	4-jet high- x SR	4-jet low- x SR	5-jet SR	6-jet SR
$N_{\text{lep}}(p_{\text{T}}^{\ell=e(\mu)} > 10\text{GeV})$	= 1	= 1	= 1	= 1
$p_{\text{T}}^{\ell=e(\mu)}$ (GeV)	> 35	> 35	> 35	> 35
N_{jet}	≥ 4	≥ 4	≥ 5	≥ 6
$p_{\text{T}}^{\text{jet}}$ (GeV)	> 325, 30, ..., 30	> 325, 150, ..., 150	> 225, 50, ..., 50	> 125, 30, ..., 30
$E_{\text{T}}^{\text{miss}}$ (GeV)	> 200	> 200	> 250	> 250
m_{T} (GeV)	> 425	> 125	> 275	> 225
$E_{\text{T}}^{\text{miss}}/m_{\text{eff}}^{\text{inc}}$	> 0.3	-	> 0.1	> 0.2
$m_{\text{eff}}^{\text{inc}}$ (GeV)	> 1800	> 2000	> 1800	> 1000
Jet aplanarity	-	> 0.04	> 0.04	> 0.04

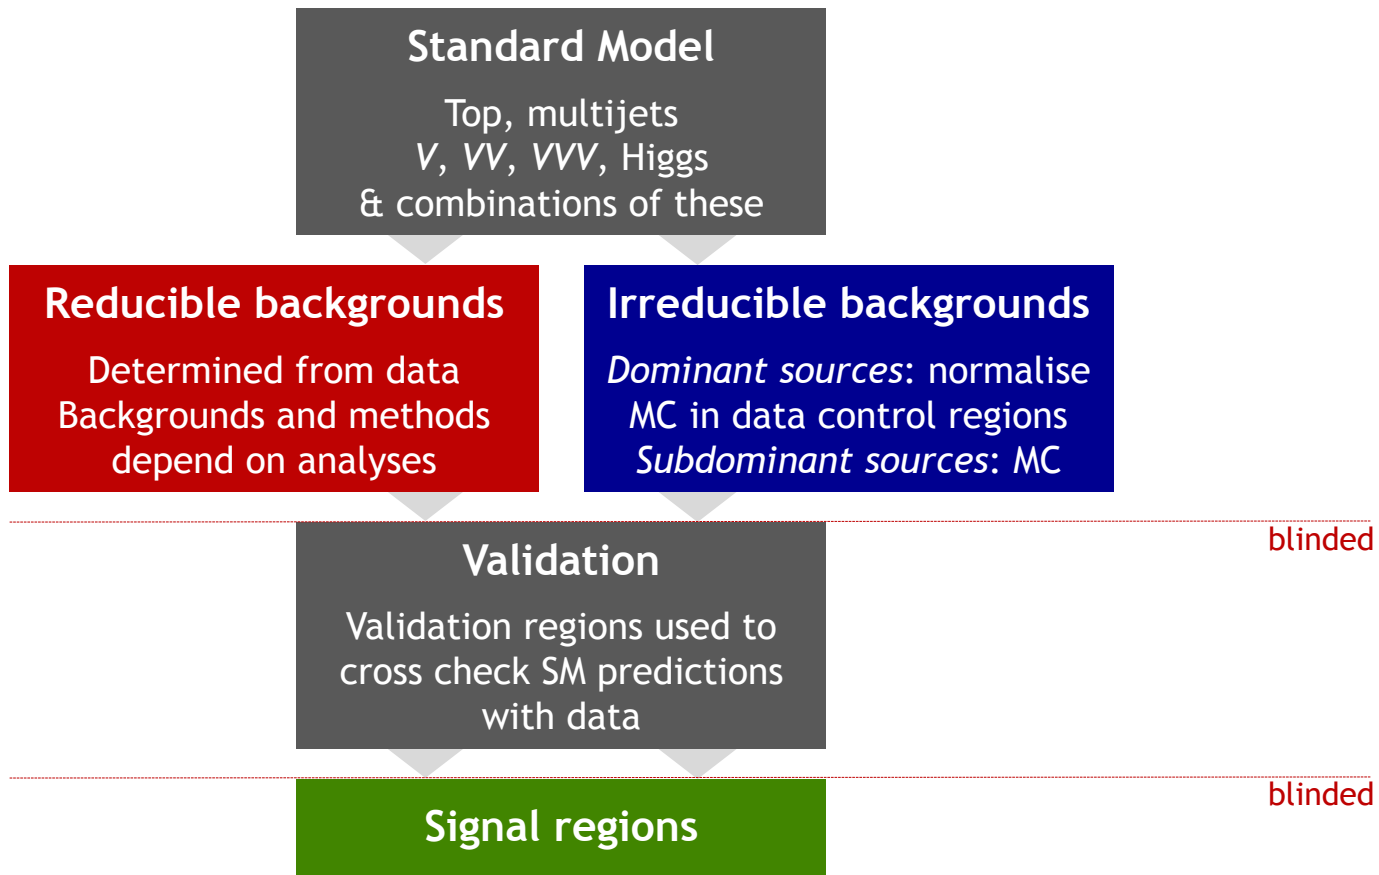

Final states: ≥ 1 lepton + multi-jets + large $E_{\text{T}}^{\text{miss}}$

■ According to signal signature, select interested final states objects: number of jets, leptons requirement

- Suppress background using SUSY discriminating variables
- The cuts are from optimization with signal significance

4: SM Background estimations (data-driven + MC)

SUSY searches rely primarily on the understanding of the SM BG

Determined from data
 Backgrounds and methods
 depend on analyses

dominant sources: normalise
 data control regions
 subdominant sources: MC

Validation
 Validation regions used to
 cross check SM predictions
 with data

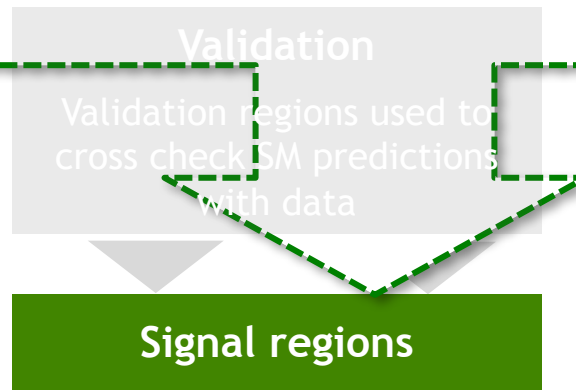

Signal regions

5: Compare SM predictions with data

arXiv:1605.04285

■ excludes gluino masses up to 1.6 TeV

6:
Interpretations

SUSY search results @ LHC and prospects at future colliders

(TeV-scale) Supersymmetry (SUSY)

P. Higgs at CMS

SUSY Search @ LHC

Strong production:

- targeting gluinos and 1st and 2nd generation squarks

- by far largest cross-sections

3rd generation:

- targeting stop and sbottoms
- Should be lowest mass squarks for naturalness reasons

Electroweak production:

- targeting Electroweakinos, sleptons
- Lowest mass particles, clean signature

RPV/LL:

- targeting R-parity violating models and long lived sparticles
- More exotic models

10⁻¹ 1 10 Mass scale [TeV]

*Only a selection of the available mass limits on new states or phenomena is shown.

†Small-radius (large-radius) jets are denoted by the letter j (J).

Resonance (di-jet)

EXO-16-056

Results interpreted in many models e.g.:

- **String resonance ~ 7.7 TeV**
- **Excited quark ~ 6 TeV**
- **W' ~ 3.3 TeV**
- **Z' ~ 2.7 TeV**

Dark Matter (暗物质)

Searches with MET+X or mediator

- **Searches in the Mono-X final states: Many models constrained up to 1-2 TeV**
- **Searches also in the Di-Jet final states exclude up to 2.6 TeV for almost whole DM range**

Leptoquarks

- Leptoquarks (LQs) arise in many models, such as grand unified theories, compositeness models and superstring theories.
- LQs: carry colour charge, fractional electric charge, and both lepton and baryon quantum numbers.
- If exist, decay into a lepton and a quark. **Search for resonance of lepton+jet in experiment.**

- $m(LQ1, LQ2) > 1.1 \text{ TeV}$
- $m(LQ3) > 0.9 \text{ TeV}$

New J. Phys. 18 (2016) 093016

CMS-PAS-B2G-16-028

No significant excess observed in 2~36fb⁻¹. Results in terms of $\beta = \text{BR}(LQ \rightarrow lq)$

Heavy quarks (额外夸克)

- **Vector-like T quark models solve hierarchy problem**
 - new heavy partner of top in loop
- Search of **T ($q=2/3$)** and **B ($q=-1/3$)** VLQ decaying to **W,H,Z** and **t,b** produced in **pairs**
- Recent **combination of 7 final states** (H(bb)t, W(lv)b, W(lv)t, Z(vv)t, Z(ll)t/b, trilepton/same-sign dilepton, fully hadronic)
- **Limits at the level of 1.3-1.4 TeV**

Prospects at Future Collider

- Long term prospects for 2 more collider scenarios have been studied (14, 33, 100 TeV @3000 fb⁻¹)
- Use same search strategy as 8-13TeV @LHC
- Use simple analysis strategies, assume 20% syst. uncertainty, avoid assumption on detector design, pileup sensitivity, etc

Prospects at HL-LHC

ATL-PHYS-PUB-2014-010

- ATLAS studied long term prospects for the (HL-)LHC with 300, 3000 fb⁻¹@14TeV
- Discovery potential up to **2.5 TeV gluinos, 1.3 TeV squarks/sbottom and 800 GeV Electroweakinos, 500 GeV stau with 3000 fb⁻¹.**

2023: ~300 fb⁻¹
 2037: ~3000 fb⁻¹

ATL-PHYS-PUB-2016-021

Prospects at HL-LHC

ATL-PHYS-PUB-2015-004

Exited quark $q^* \rightarrow qg$: di-jet
 6 \rightarrow 8 TeV

ATL-PHYS-PUB-2017-002

$Z' \rightarrow t\bar{t}$

3 \rightarrow 4 TeV

Future hadron collider projects in a nutshell

-- The next discovery machine

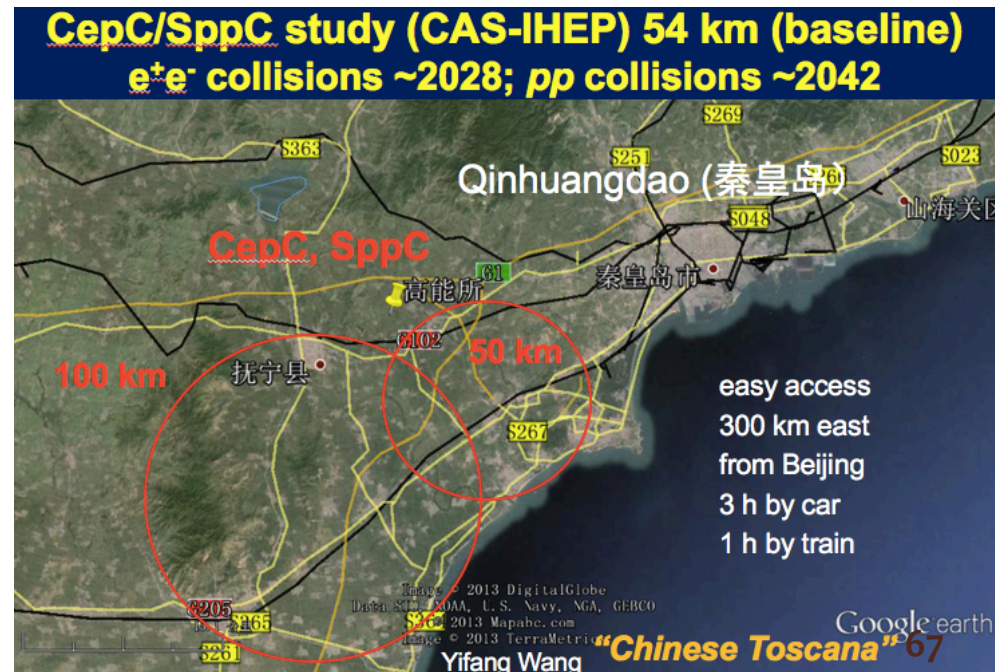

HL-LHC: $E_{CM} = 14 \text{ TeV}$, 3 ab^{-1} , 2026~2035... (formally approved as *project* by CERN council last week)

Future Circular Collider FCC-hh (CERN):

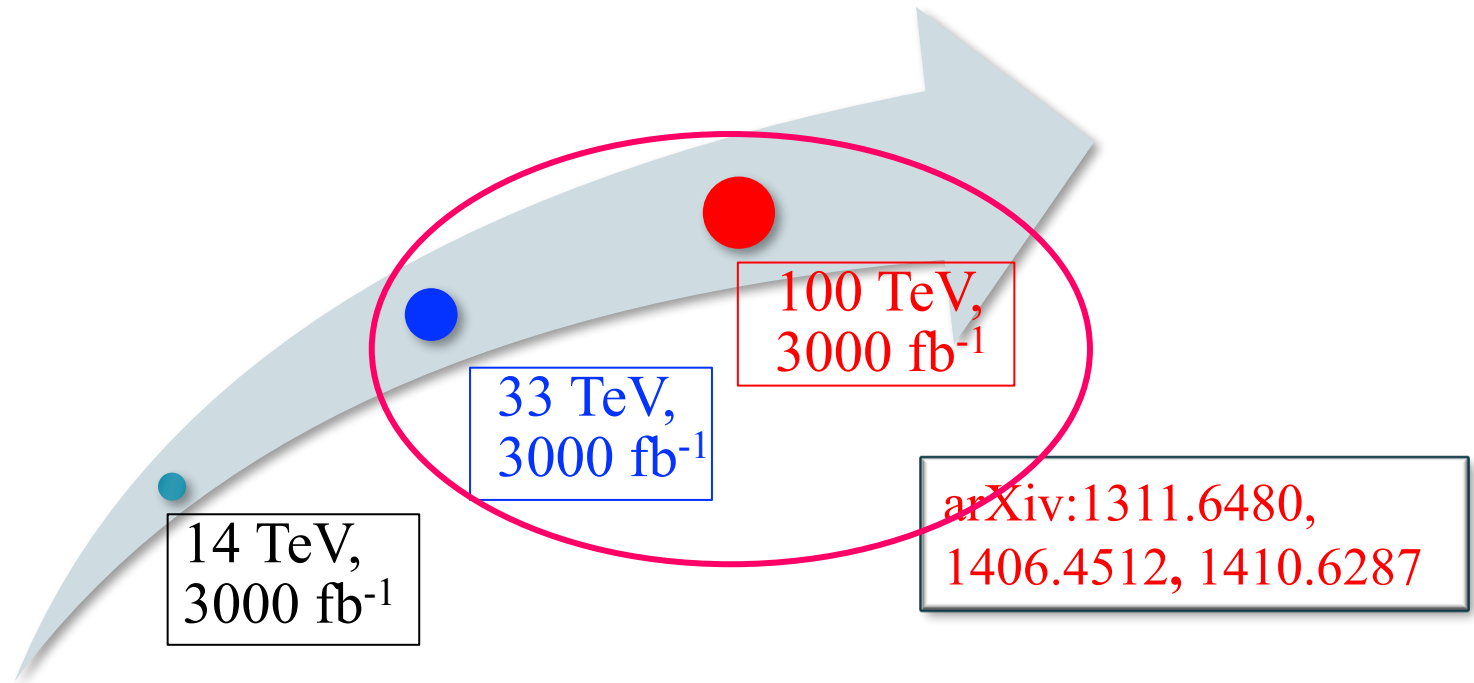

- $E_{CM} \sim 100 \text{ TeV}$ in 100 km ring, $L \sim 2 \times 10^{35} \text{ s}^{-1}\text{cm}^{-2}$
- ~16 T magnets, possibly HE-LHC ($E_{CM} \sim 28 \text{ TeV}$) as intermediate stage
- Huge detectors for muon p_T measurement
- Possible start of physics ~ 2035

SppC (China):

- $E_{CM} \sim 71 \text{ TeV}$ in 55 km ring, $L \sim 1 \times 10^{35} \text{ s}^{-1}\text{cm}^{-2}$
- Requires very high gradient dipole magnets ~ 20 T
- Possible start of physics ~ 2042

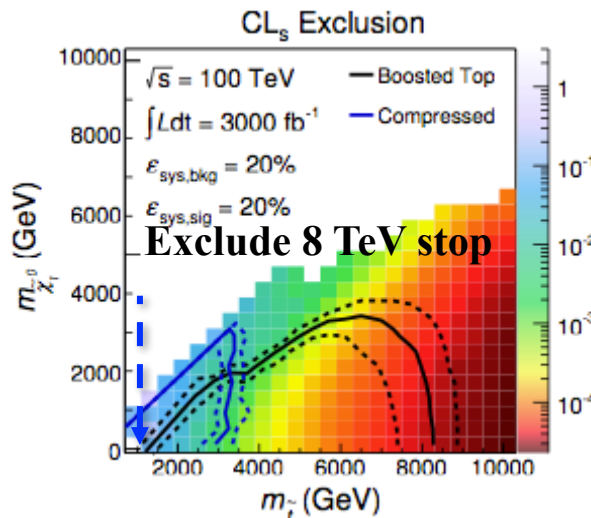

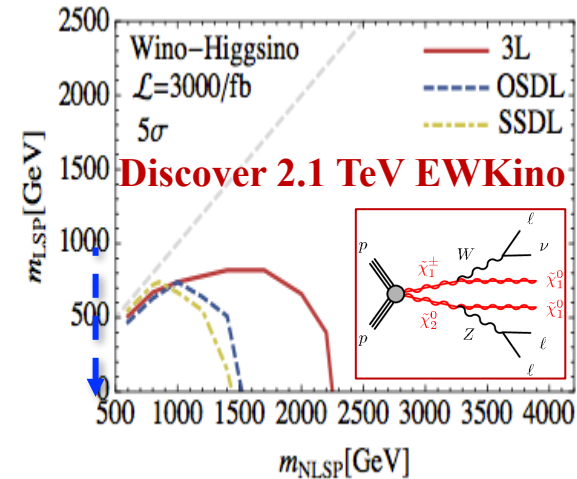

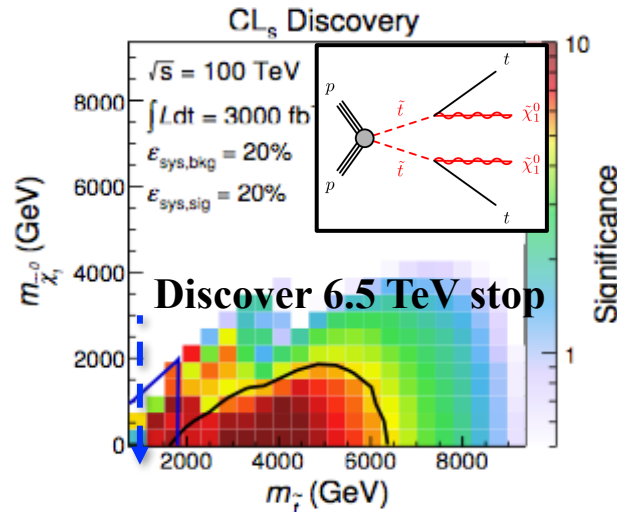

Prospects at Future Collider

- Long term prospects for 2 more collider scenarios have been studied (14, **33**, **100 TeV @3000 fb⁻¹**)
- Use same search strategy as 8-13TeV @LHC
- Use simple analysis strategies, assume 20% syst. uncertainty, avoid assumption on detector design, pileup sensitivity, etc

Prospects at Future Collider

Discovery potential (exclusion) up to 11(13) TeV gluinos, 6.5(8) TeV squarks/sbottom and 2.1(3.2) TeV Electroweakinos.

***The journey into new physics territory
has just only begun, and for sure, exciting times are
ahead of us!***

- $\sqrt{s} = 14 \text{ TeV}$ (7 times higher than Tevatron/Fermilab)
→ search for new massive particles up to $m \sim 5 \text{ TeV}$
- $L_{\text{design}} = 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$ ($>10^2$ higher than Tevatron/Fermilab)
→ search for rare processes with small σ ($N = L\sigma$)

Discovery and exclusion

- P-value=probability that result is as/less compatible with the hypothesis

DISCOVERY:

- The null hypothesis H_0 describes background only
 - If the p -value of H_0 is found below a given threshold, one can consider looking for a better model
 - In HEP, $Z \geq 5$ is conventionally required to claim a discovery
- The alternative hypothesis H_1 describes signal + background
 - The alternative hypothesis is supposed to fit the data very well for claiming a discovery

EXCLUSION:

- The null hypothesis H_0 describes signal + background
 - One is interested into setting an upper limit to the intensity of the signal alone
- The alternative hypothesis H_1 describes background only
 - No real need to test for it
 - The background-only model becomes important only in case of discovery

Interpretation strategy

Based on the number of observed, expected events in all regions with all uncertainties:
Probability density function (PDF)

Likelihood function: $L(\mu, \theta)$

μ : signal strength (POI);

θ : nuisance parameters (NP)

Profile Likelihood: constrain uncertainty (NP) as part of a likelihood fit

Construct test statistics t_μ based on likelihood ratio λ :

$$\tilde{\lambda}(\mu) = \begin{cases} \frac{L(\mu, \hat{\theta}(\mu))}{L(\hat{\mu}, \hat{\theta})} & \hat{\mu} \geq 0, \\ \frac{L(\mu, \hat{\theta}(\mu))}{L(0, \hat{\theta}(0))} & \hat{\mu} < 0 \end{cases}$$

$$t_\mu = -2 \ln \lambda(\mu)$$

From the constructed distribution of test statistic for s+b, find the p-value of the observation

$$p_\mu = \int_{t_{\mu, \text{obs}}}^{\infty} f(t_\mu | \mu) dt_\mu$$

Construct the PDF of test statistic t_μ : generate toy Monte Carlo or using asymptotic formula

Find the observed test statistic for tested μ : $t_{\mu, \text{obs}}$

If $CL_s < 0.05$: the value of signal is excluded at 95% CL.....

$$CL_s = \frac{CL_{s+b}}{CL_b} = \frac{p_{s+b}}{1 - p_b}$$

The above check has been done for each signal grid points on the SUSY model.

The line can be drawn for the area where points are excluded

Simultaneous fit

- Background estimates in SRs are obtained by a *simultaneous fit* in each channel based on the profile likelihood method. Three dedicated fit for different purpose...
- **Background-only fit**
 - Fit for all CRs, excluding SRs.
 - **Get background-only estimates.**
 - Also extrapolate to VRs (non used in fit, only for cross-check) and SRs.
- **Discovery fit**
 - Fit for all CRs and SRs.
 - Signal contamination is turned off in CRs and set as a dummy number 1 in SR (so, the fitted non-SM signal strength = the excess in Nevents of SR)
 - **Get model-independent upper limit on signal in SR.**
- **Exclusion fit**
 - Fit for all CRs and SRs.
 - Signal is turned on in all regions, according to model-dependent prediction.
 - **Got signal model-dependent exclusion from all CRs+SRs → final exclusion contours for SUSY model**
- The basic strategy is to share background information in all regions (CR, SR, VR). The background parameters are predominantly constrained by CRs with large statistics, which in turn reduces the impact of uncersts in SR.

A Toroidal LHC Apparatus

- 42m × 22m, 7000 ton

	Detector characteristics	
	Width:	44m
	Diameter:	22m
	Weight:	7000t
CERN AC - ATLAS V1997		

Inner Detector (2T solenoid, $|\eta| < 2.5$):

$$\sigma_{p_t}/p_t \approx 0.05\%/GeV \times p_t \oplus 1\%$$

Calorimetry:

* electromagnetic, $|\eta| < 3.2$

$$\sigma_E/E \approx 10\% \sqrt{GeV}/\sqrt{E} \oplus 0\%$$

* hadronic (central, $|\eta| < 1.7$)

$$\sigma_E/E \approx 50\% \sqrt{GeV}/\sqrt{E} \oplus 3\%$$

* hadronic (endcaps, $1.7 < |\eta| < 3.2$)

$$\sigma_E/E \approx 60\% \sqrt{GeV}/\sqrt{E} \oplus 3\%$$

* hadronic (forward, $3.2 < |\eta| < 4.9$)

$$\sigma_E/E \approx 100\% \sqrt{GeV}/\sqrt{E} \oplus 5\%$$

Muon system ($\sim 4T$ toroid, $|\eta| < 2.7$):

$$\sigma_{p_t}/p_t \approx 10\% \text{ for } p_t(\mu) \approx 1 \text{ TeV}/c$$

➤ **Inner Detector:** Highly segmented silicon strips, determine very accurately charged particles trajectories

➤ **Solenoid Magnet:** Solenoid coil that generates a 2T magnetic field in the region of the Inner Detector

➤ **Electromagnetic Calorimeter:** Electron and photon energies are measured through electromagnetic showers

➤ **Hadronic Calorimeter:** Hadrons interact with dense material and produce a shower of charged particles

➤ **Toroid Magnets:** 8 toroidal coils that create a 0,4T magnetic field in the area of the Muon Spectrometer

➤ **Muon Spectrometer:** Muons traverse the rest of the detector and are measured in its outer layers

The Higgs mechanism, an analogy...

D. Miller
(UC London)

The Higgs field fills all space

A 'particle' that moves in the Higgs field ...

... moves slower the more it attract attention (**interacts with the Higgs field, generating its mass, the larger, the stronger its interactions...**)

The Higgs particle, an analogy...

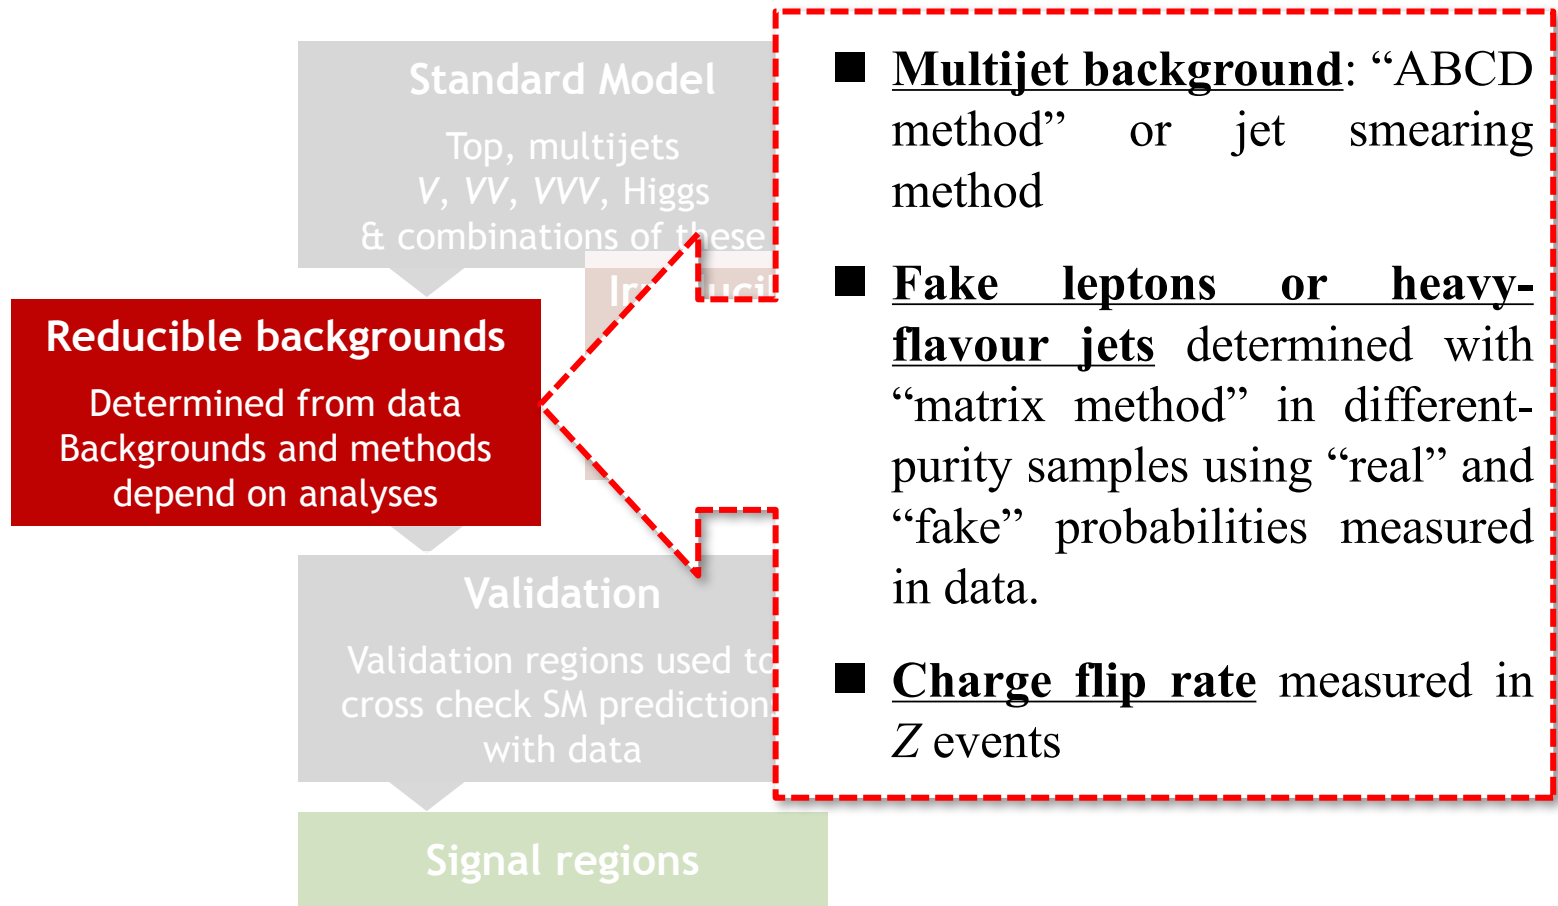

Somebody whispers a rumour into the room...

... and the field starts to get excited and interact with itself giving birth to a **massive particle**

SM Background Estimation

SUSY searches rely primarily on the understanding of the SM BG

SM Background Estimation

SUSY searches rely primarily on the understanding of the SM BG

Normalise MC prediction in SRs using dedicated CRs → transfer factor: T

The Worldwide LHC Computing Grid (WLCG)

- Tier-0 (CERN):**
- Data recording
 - Initial data reconstruction
 - Data distribution
- Tier-1 (12 centres):**
- Permanent storage
 - Re-processing
 - Analysis
 - Simulation
- Tier-2 (68 federations of >100 centres):**
- Simulation
 - End-user analysis

SUSY models: good sale in market

■ Simplified Models:

- Not really a model ($Br \sim 100\%$, most masses fixed at high scales)
- Important tool for signal region optimization & interpretation

■ Phenomenological models:

- pMSSM: captures “most” of phenomenologic features of R-parity conserving MSSM
 - 19 free parameters: M_1, M_2, M_3 ; $\tan \beta$, μ and m_A ; 10 sfermion mass parameters; A_t , A_b and A_τ
 - Comprehensive and computationally realistic approximation of the MSSM with neutralino LSP
- GGM (gravitino)

■ Complete SUSY models: mSUGRA, GMSB ...
