ISTITUTO DI ASTROFISICA SPAZIALE E FISICA COSMICA - BOLOGNA

BeppoSAX/GRBM

- 4 independent CsI(Na) slabs (1 x 27.5 x 41.3 cm³)
- Geom area: 1136 cm² each
- 2 energy bands:
 - 40-700 keV
 - > 100 keV

C/R time resolution:

- 1 s (continuous)
- 7.8ms/0.5ms (GRB trigger)
- Low-inclination (~3°)orbit

BeppoSAX/GRBM

- 4 independent CsI(Na) slabs (1 x 27.5 x 41.3 cm³)
- Geom area: 1136 cm² each
- 2 energy bands:
 - 40-700 keV
 - > 100 keV

C/R time resolution:

- 1 s (continuous)
- 7.8ms/0.5ms (GRB trigger)
- Low-inclination (~3°)orbit

BeppoSAX/GRBM background modelling: what for?

Science Motivations

- Sensitive search for dim, long-lasting (~10³ s) events so far undetected
 - Cross-check of fast X-ray transients (FXTs) detected in the BeppoSAX Wide Field Cameras
 - Low-luminosity GRBs (possibly different class; shock breakout emission)
 - Possible counterparts to Fast Radio Bursts (DeLaunay+16)
 - Dim, long-lived tails following major events
- Monitoring of bright, hard sources such as CygX-1 in the 40-700 keV

First preliminary attempt prior to adopting machine learning

Example: FXT (GRB?) 010501B

(bkg modelled by averaging out similar orbits)

FXT 010501B: close in

Potential for CygX-1

CygX-1: rate history (prelim)

Then we moved on towards a machine learning approach

 Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour

- Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour
- Partition the entire data set so as to group observations with similar background (based on the attributes that have previously been identified)

- Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour
- Partition the entire data set so as to group observations with similar background (based on the attributes that have previously been identified)
- Address a regression problem adopting a supervised learning:

- Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour
- Partition the entire data set so as to group observations with similar background (based on the attributes that have previously been identified)
- Address a regression problem adopting a supervised learning:
 - Split the data set into a training set and a validation set

- Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour
- Partition the entire data set so as to group observations with similar background (based on the attributes that have previously been identified)
- Address a regression problem adopting a supervised learning:
 - Split the data set into a training set and a validation set
 - Explore the dependence of background on attributes using the training set

- Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour
- Partition the entire data set so as to group observations with similar background (based on the attributes that have previously been identified)
- Address a regression problem adopting a supervised learning:
 - Split the data set into a training set and a validation set
 - Explore the dependence of background on attributes using the training set
 - We currently use a **linear regression** (maximum likelihood estimation)

- Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour
- Partition the entire data set so as to group observations with similar background (based on the attributes that have previously been identified)
- Address a regression problem adopting a supervised learning:
 - Split the data set into a training set and a validation set
 - Explore the dependence of background on attributes using the training set
 - We currently use a **linear regression** (maximum likelihood estimation)
 - Next we plan on using generalized linear models (GLMs)

- Identify a few characteristics (=features/attributes in the ML parlance) that are thought/known to mostly contribute to determine the background level and behaviour
- Partition the entire data set so as to group observations with similar background (based on the attributes that have previously been identified)
- Address a regression problem adopting a supervised learning:
 - Split the data set into a training set and a validation set
 - Explore the dependence of background on attributes using the training set
 - We currently use a **linear regression** (maximum likelihood estimation)
 - Next we plan on using generalized linear models (GLMs)
 - Estimate mean, median, and overall absolute error distributions on validation set

- Basic data unit definition:
 - **orbit** (counts within a ~5-ks time window)

- Basic data unit definition:
 - **orbit** (counts within a ~5-ks time window)
- Data selection:
 - remove orbits affected by known GRBs, solar X-ray flares, data gaps

- Basic data unit definition:
 - **orbit** (counts within a ~5-ks time window)
- Data selection:
 - remove orbits affected by known GRBs, solar X-ray flares, data gaps
- Starting set of orbit attributes:
 - Spacecraft (s/c) attitude
 - Portion of visible (=not Earth-blocked) sky
 - Positions (wrt s/c frame) of Crab, CygX-1, Sun (hard X-ray bright sources)
 - Vertical geoagnetic cutoff rigidity and geomagnetic coordinates of s/c
 - Epoch
 - Particle Monitor data

- Basic data unit definition:

- Data selection:
 - remove orbits affected by known GRBs, solar X-ray flares, data gaps
- Starting set of orbit attributes:
 - Spacecraft (s/c) attitude
 - Portion of visible (=not Earth-blocked) sky
 - Positions (wrt s/c frame) of Crab, CygX-1, Sun (hard X-ray bright sources)
 - Vertical geoagnetic cutoff rigidity and geomagnetic coordinates of s/c
 - Epoch
 - Particle Monitor data
- Orbit grouping based on s/c attitude:
 - Composition of a number of separate "orbit families"
 - Apply supervised ML regression within each family indepdendently of one another

Several consecutive orbits

Single orbit

• Each family has a father OP

- Each family has a father OP
- All members have pointing differing by < 30 degrees from the father (axis by axis)

- Each family has a father OP
- All members have pointing differing by < 30 degrees from the father (axis by axis)
- Fathers chosen so as to maximise mutual distances (least anisotropic grouping = optimal sky coverage)

- Each family has a father OP
- All members have pointing differing by < 30 degrees from the father (axis by axis)
- Fathers chosen so as to maximise mutual distances (least anisotropic grouping = optimal sky coverage)
- Results:
 - 115 families
 - 17072 good orbits (after selection)

- Each family has a father OP
- All members have pointing differing by < 30 degrees from the father (axis by axis)
- Fathers chosen so as to maximise mutual distances (least anisotropic grouping = optimal sky coverage)
- Results:
 - 115 families
 - 17072 good orbits (after selection)

average = 148 orbits/family

Distribution of the number of orbits per family

Bright sources removal: occultation technique

To ease comparison between different orbits, we preliminarily removed the contribution of Crab and of CygX-1 after estimating their rate with the occultation technique

Occultation step: e.g. Crab

Occultation step: e.g. Crab

Occultation step: e.g. Crab

 A ML linear regression approach looks promising. We're still in the process of refining the supervised learning tuning the set of attributes that play a role.

- A ML linear regression approach looks promising. We're still in the process of refining the supervised learning tuning the set of attributes that play a role.
- Ultimate goal: systematic search for weak, slow-varying events to constrain low-lum GRB rate (e.g. 060218, 100316D, 171205A; paper in prep)

- A ML linear regression approach looks promising. We're still in the process of refining the supervised learning tuning the set of attributes that play a role.
- Ultimate goal: systematic search for weak, slow-varying events to constrain low-lum GRB rate (e.g. 060218, 100316D, 171205A; paper in prep)
- Search for Fast Radio Burst putative counterparts

- Ultimate goal: systematic search for weak, slow-varying events to constrain low-lum GRB rate (e.g. 060218, 100316D, 171205A; paper in prep)
- Search for Fast Radio Burst putative counterparts
- Extract complete LC (40-700 and >100 keV) of CygX1 and study variability

- A ML linear regression approach looks promising. We're still in the process of refining the supervised learning tuning the set of attributes that play a role.
- Ultimate goal: systematic search for weak, slow-varying events to constrain low-lum GRB rate (e.g. 060218, 100316D, 171205A; paper in prep)
- Search for Fast Radio Burst putative counterparts
- Extract complete LC (40-700 and >100 keV) of CygX1 and study variability
- Once the procedure will be optimised on BSAX data, a similar approach can be applied to HXMT data, building upon the knowledge of the role(s) played by the different attributes.

Thank you
