# Motivation

- Exclusive P-wave Charmonium states  $\chi_{cJ}$  ( $J=0,1,2$ )  $\rightarrow \Sigma^- \bar{\Sigma}^+$  into baryon-antibaryon pairs ( $B\bar{B}$ ) are considered to be a favorable test of pQCD models and QCD based calculations.
- The  $\chi_{cJ}$  mesons are not produced directly in  $e^+e^-$  annihilations but assumed to process via annihilations of the constituents  $c\bar{c}$  pairs into three gluons or virtual photon.

**Figure:** Feynman graphs for  $\psi(2S)$  decay into  $B\bar{B}$  (a) Three-gluon contribution  
(b) Electromagnetic contribution.

- The large BFs of  $\psi(2S) \rightarrow \gamma \chi_{cJ}$  make  $e^+e^-$  collision at the  $\psi(2S)$  energy a very clean environment for  $\chi_{cJ}$  investigation.
- The COM play an important role to describing these P-wave quarkonium decays and predictions of this model  $\chi_{cJ}$  to pair of mesons and baryons are in agreement with earlier experiment.
- BF of  $\chi_{cJ} \rightarrow \Sigma^+ \bar{\Sigma}^-$  had been well measured by BesIII [1] and CLEO [2].  
[1].Phys. Rev. D 97, 052011, [2].PhysRevD.78.031101
- Experimentally, no measurements for  $\chi_{cJ} \rightarrow \Sigma^- \bar{\Sigma}^+$  have been performed yet.

# Measurement of Branching Fractions of $\chi_{cJ} \rightarrow \Sigma^- \bar{\Sigma}^+$

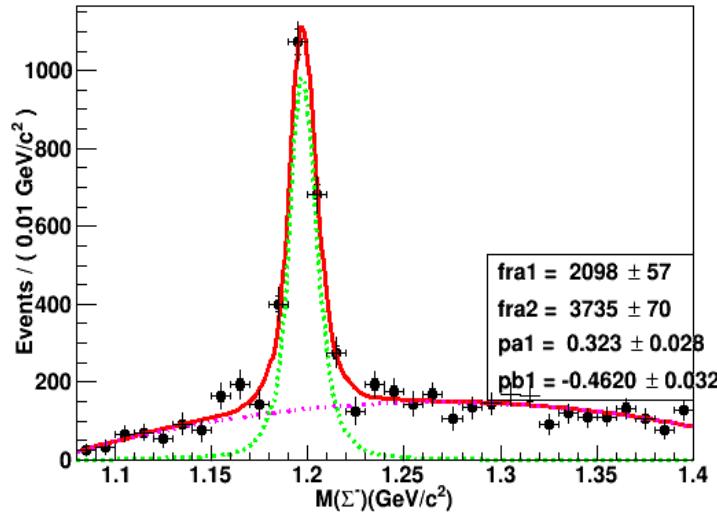

# Extraction of Signal $\chi_{cJ} \rightarrow \Sigma^- \bar{\Sigma}^+$

- The peaking background have been seen in both  $\Sigma^-$  and  $\chi_{cJ}$  mass spectrum.
- The constitution of peaking backgrounds are complex.
- Here, we fit the  $M(\chi_{cJ})$  in each  $\Sigma^-$  mass interval of data and extracted the number of signal events of  $N_{\chi_{c0}}$  and upper limit for  $\chi_{c1}$  and  $\chi_{c2}$ .

# Summary

- By Reconstruction of  $\gamma n\bar{n}\pi^+\pi^-$  final states, the process of  $\chi_{cJ} \rightarrow \Sigma^-\bar{\Sigma}^+$  are observed for the first time at BESIII.
- The signal is extracted by fitting of  $M(\chi_{cJ})$  mass spectra (*un-binned*) in each  $\Sigma^-$  mass interval (*bin-by-bin*).
- The branching fraction of  $\chi_{cJ} \rightarrow \Sigma^-\bar{\Sigma}^+$  to be given, which are consistent with  $\chi_{cJ} \rightarrow \Sigma^+\bar{\Sigma}^-$  process.

# Extraction of Signal for $\chi_{cJ} \rightarrow \Sigma^+ \bar{\Sigma}^-$

- The peaking background have been seen in both  $\Sigma^+$  and  $\chi_{cJ}$  mass spectrum.
- The constitution of peaking backgrounds are complex.
- Here, we fit the  $M(\chi_{cJ})$  mass spectra in each  $\Sigma^+$  mass interval of data and extracted the number of signal events for  $N_{\chi_{c0}}, N_{\chi_{c1}}, N_{\chi_{c2}}$ .

Noted that if we cut the mass of sigma^-, Nominal value of chic\_2 is not changes and statistical uncertainty also remain same, Also, we have seen that no. of observed events not increasing ,So we can say this is not cause in systematic uncertainty in fitting method
