Measurements of hadronic cross sections at low-energy e^+e^- colliders

Wednesday, August 21, 2019 4:05 PM (35 minutes)

The low-energy e^+e^- colliders provide important information on hadronic cross sections from e^+e^- annihilation.

Besides rich dynamics involved in hadron production itself, such measurements also give an input to the calculation of various fundamental quantities like muon $g-2$, running α and others from various QCD applications.

A review of recent results from the Novosibirsk e^+e^- experiments will be presented.

The projects of the Super C-Tau factories in Novosibirsk and in China will be also briefly discussed.
