XVIII International Conference on Hadron Spectroscopy and Structure (HADRON2019)

Contribution ID: 33

Type: Plenary

Measurements of hadronic cross sections at low-energy e+e- colliders

Wednesday, 21 August 2019 16:05 (35 minutes)

The low-energy e+e- colliders provide important information on hadronic cross sections from e+e- annihilation.

Besides rich dynamics involved in hadron production itself, such measurements also give an input to the calculation of various fundamental quantities like muon g-2, running alpha and others from various QCD applications.

A review of recent results from the Novosibirsk e+e- experiments will be presented. The projects of the Super C-Tau factories in Novosibirsk and in China will be also briefly discussed.
