- $\Gamma_{\psi(4 S, 5 S, 6 S)} \sim \mathrm{MeV}$
- $\Gamma_{\psi(3 D, 4 D, 5 D)} \sim 0.1 \mathrm{MeV}$

## ${ }^{3} P_{0}$ Model

- In the ${ }^{3} P_{0}$ model, a light $q \bar{q}$ pair is created with the vacuum quantum number $J^{P C}=0^{++}$, and then rearranged with the quarks within the initial meson to produce two final mesons.

$$
\begin{equation*}
J^{P C}=0^{++} \Rightarrow L=1, S=1 \Rightarrow{ }^{2 S+1} L_{J}={ }^{3} P_{0} \tag{5}
\end{equation*}

## Transition operator

- Interaction Hamiltonian PRD 54, 6811 (1996)

$$
\begin{equation*}
H_{\mathrm{int}}=g_{s} \int \mathrm{~d}^{3} \mathbf{x} \bar{\psi} \psi \tag{6}
\end{equation*}
$$

where

$$
\begin{equation*}
\gamma=g_{s} / 2 m_{q} \tag{7}
\end{equation*}
$$

- Decay amplitude

$$
\begin{equation*}
\delta^{(3)}\left(\mathbf{P}_{f}-\mathbf{P}_{i}\right) \mathcal{M}^{M_{J_{A}} M_{J_{B}} M_{J_{C}}}=\langle f| H_{\mathrm{int}}|i\rangle \tag{8}
\end{equation*}
$$

- In the nonrelativistic limit, the transition operator reads

$$
\begin{align*}
T= & -3 \gamma \sum_{m}\langle 1 m ; 1-m \mid 00\rangle \int \mathrm{d}^{3} \mathbf{k}_{4} \mathrm{~d}^{3} \mathbf{k}_{5} \delta^{3}\left(\mathbf{k}_{4}+\mathbf{k}_{5}\right) \mathcal{Y}_{1}^{m}\left(\frac{\mathbf{k}_{4}-\mathbf{k}_{5}}{2}\right) \\

\end{align*}
$$

## Transition operator

- Two pairs of $q \bar{q}$ are created in the three body open flavor decay processes

- At the 2nd order EPJC 78, 605 (2018)

$$
\begin{align*}
