Cutflow table

Introduction

- The model is a simple gluon fusion production;
- A heavy scalar R , which decays to SH ;
- Then $H \rightarrow 4\ell$ and $S \rightarrow E_T^{\text{miss}}$ in the form of neutrinos;
- This is the same model as the $H \rightarrow \gamma\gamma/Z\gamma$ case; and

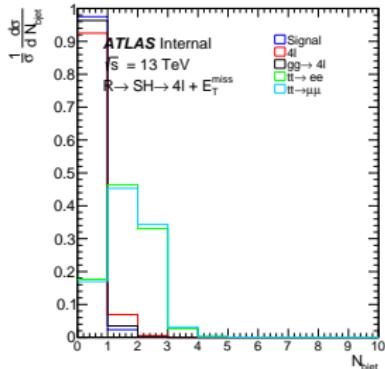

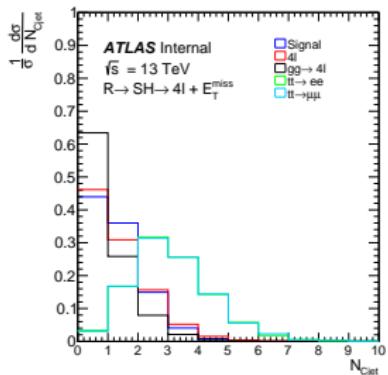

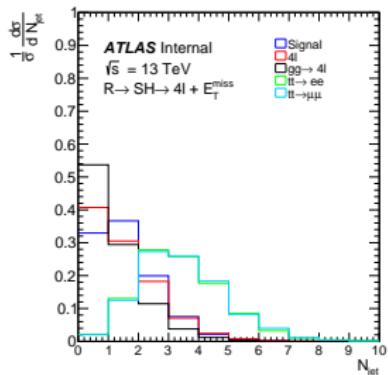

- Build optimization framework for this signal.

Event selection

- Electrons:
 - $|\eta| < 2.47$
 - $p_T > 7 \text{ GeV}$
- Muons:
 - $|\eta| < 2.7$
 - $p_T > 5 \text{ GeV}$
- Jets:
 - $|\eta| < 4.5$
 - $p_T > 30 \text{ GeV}$
- Four lepton cuts

Kinematic distributions

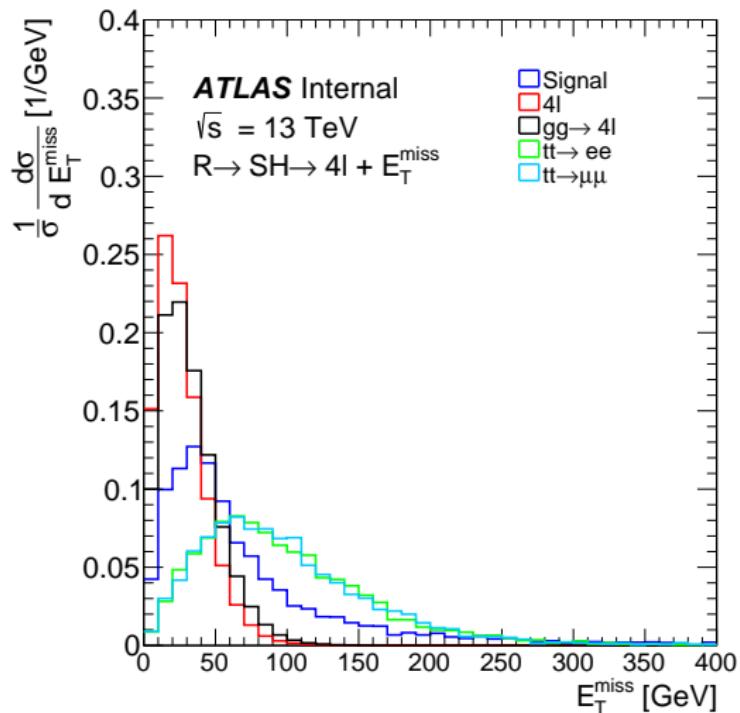

Number of jets multiplicity and b-jet

Kinematic distributions

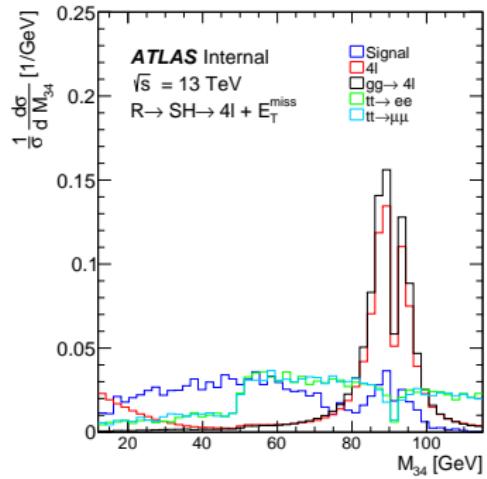

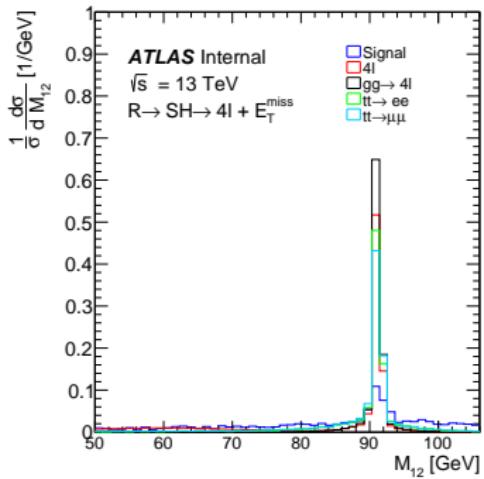

Missing transverse energy

6

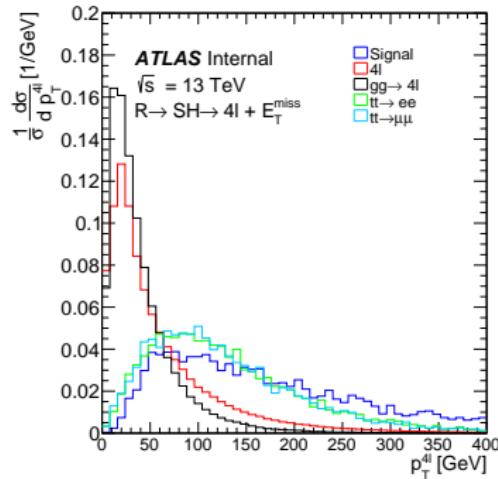

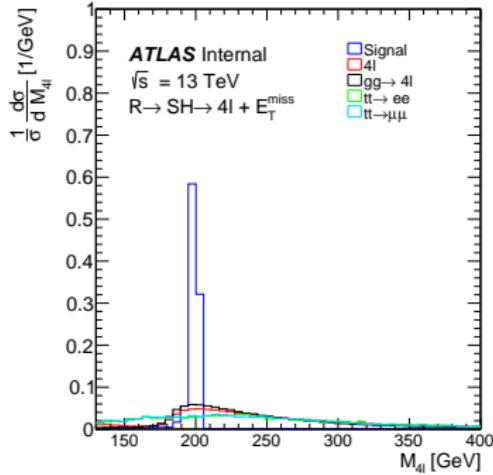

Kinematic distributions

Dilepton invariant mass distribution

Kinematic distributions

Four leptons invariant mass distribution

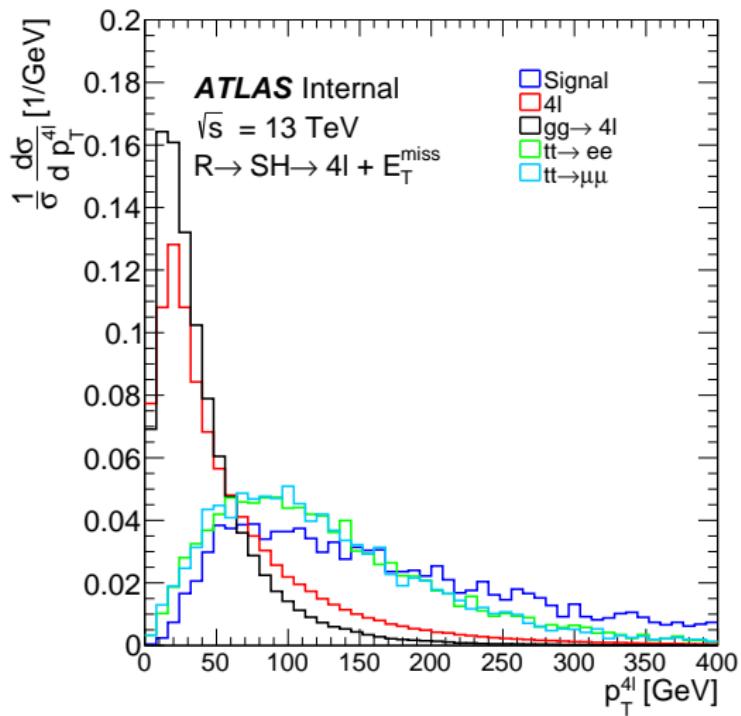

- Can we optimize the signal by getting on the $M_{4\ell}$ and $p_T^{4\ell}$?

Kinematic distributions

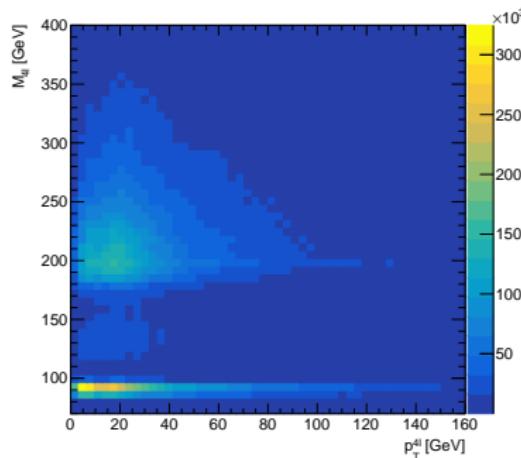

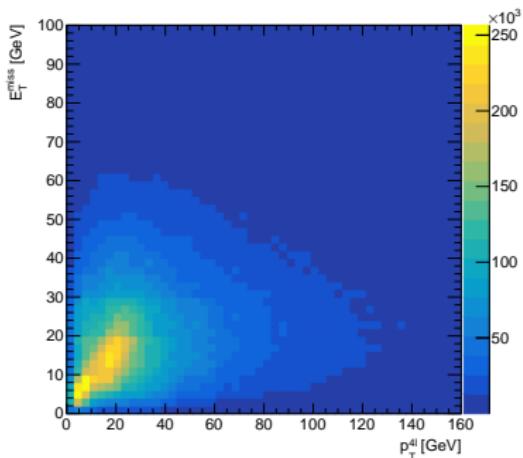

Four leptons invariant mass distribution

9

Correlation between $p_T^{4\ell}$, E_T^{miss} and $M_{4\ell}$

10

- Trying to get the maximum significance by doing 2D scan of a grid of (a, b); and
- Install the significances on the z-axes of the 2D plot.

Cutflow table

	Signal	4ℓ	$gg \rightarrow 4\ell$	$tt \rightarrow ee$	$tt \rightarrow \mu\mu$	Significance
4ℓ	100.00 %	100.00 %	100.00 %	100.00 %	100.00 %	6.21
B-veto	97.51 %	92.49 %	96.35 %	17.66 %	16.99 %	6.31
$N_{Cjet} = 0$	43.83 %	46.15 %	63.42 %	3.37 %	3.06 %	3.88
$p_T^{4\ell} > 20$	43.51 %	24.39 %	34.61 %	3.25 %	2.94 %	5.26
$E_T^{\text{miss}} > 20$	33.08 %	15.00 %	25.10 %	3.17 %	2.90 %	4.96

	Signal	4ℓ	$gg \rightarrow 4\ell$	$tt \rightarrow ee$	$tt \rightarrow \mu\mu$	Significance
4ℓ	100.00 %	100.00 %	100.00 %	100.00 %	100.00 %	6.21
B-veto	97.51 %	92.49 %	96.35 %	17.66 %	16.99 %	6.31
$N_{Cjet} \geq 1$	53.68 %	46.34 %	32.93 %	14.29 %	13.92 %	5.09
$E_T^{\text{miss}} > 20$	50.24 %	29.07 %	23.85 %	13.84 %	13.55 %	5.92

Thank you!
