

# GEANT Status of the CEPC LumiCal Design

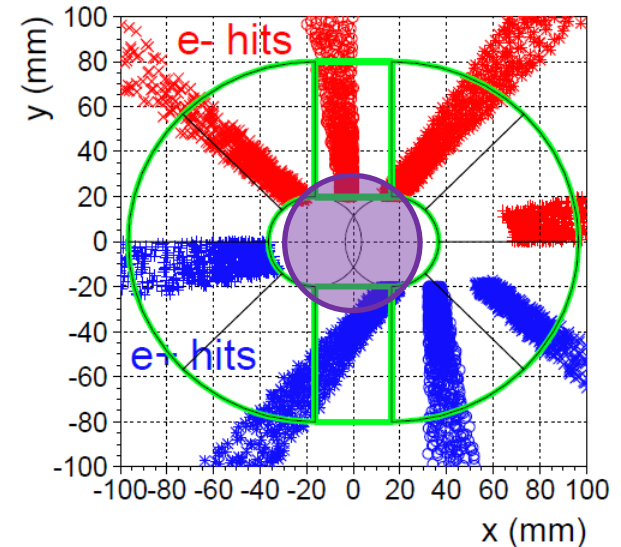

CEPC workshop 2019

2019.11.19

17:00 IHEP A511

Suen Hou

Academia Sinica

# Outline

- **Bhabha cross section**

boost by beam crossing, favoring small beam pipe  
 $r < 30 \text{ mRad} \rightarrow \sigma(\text{Bhabha}) > \sim 50 \text{ nb}$

- **Beampipe material**

smearing to electron impact position  
shower leakage to Tracker

- GEANT with a cone shape beam pipe

- Perspectives for  $10^{-4}$  luminosity precision

# Luminosity measurement

- Z-lineshape,  $e^+e^- \rightarrow Z \rightarrow q\bar{q}$  is dominant,
  - Luminosity is best provided by detecting\ Bhabha,  $e^+e^- \rightarrow e^+e^-$ , elastics scattering
    - a pure QED process, theoretical MC to  $<0.1\%$  precision
    - triggering on a pair of scattered  $e^+e^-$
- $E(e^\pm) \sim E_{beam}$ , **Back-to-Back**

$$\sigma = \frac{16\pi\alpha^2}{s} \left( \frac{1}{\theta_{min}^2} - \frac{1}{\theta_{max}^2} \right)$$

# Bhlumi calculations

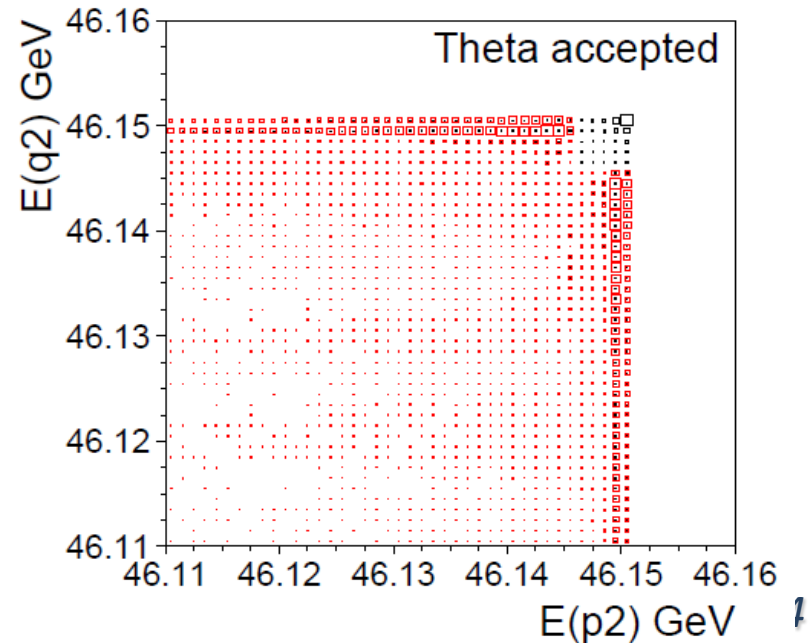

1. Theta range input : **Th1, Th2**  
Xcru calculated for Thmin=0.7xTh1 to 2xTh2
2. KeyWgt=0 → event wgt=1, for simulation  
count events in chosen condition  
scale to Xcru

**BARE1 X section: (of the bhlumi paper)**

**Th1 <  $\theta_1'$  and  $\theta_2' < \text{Th2}$ ,  $s' > 0.5s$**

**Use BARE1 as reference**

**Having photon (red histogram) or not  
→ 5 MeV precision**

# BHLUMI theoretical precision

**Bhlumi 4.04 writeup: CERN-TH/96-158**

[cds.cern.ch/record/310621/files/th-96-158.ps.gz](http://cds.cern.ch/record/310621/files/th-96-158.ps.gz)

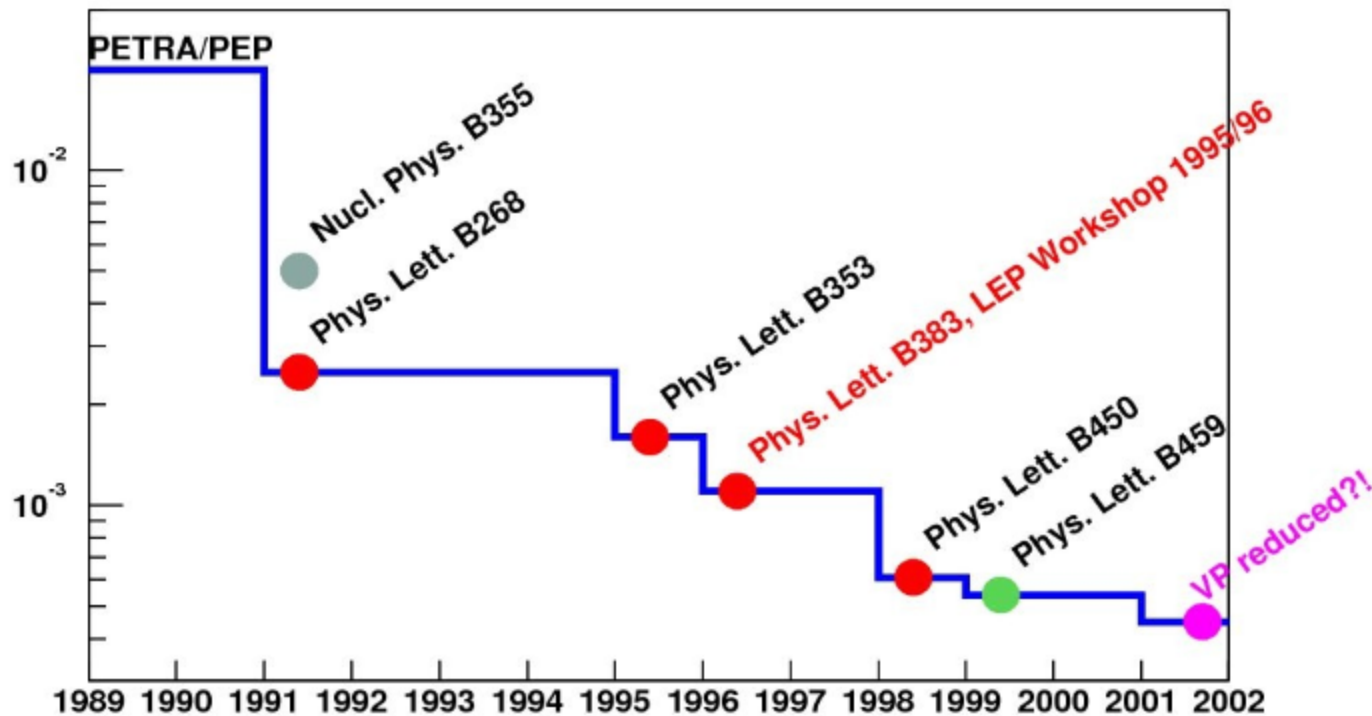

[http://cern.ch/~jadach/public/Bhlumi-linux-4.04-export\\_2002.11.05.tar.gz](http://cern.ch/~jadach/public/Bhlumi-linux-4.04-export_2002.11.05.tar.gz)

Theory uncertainty: 0.25% was **BHLUMI 2**, reported in CPC package paper

<http://inspirehep.net/record/321226?ln=en>

The latest **BHLUMI 4** report is pushed to **< 0.1%**

Evolution of luminosity theoretical error at LEP1

# Reproduce BHLUMI to 0.1%

Bhlumi-linux-4.04-export\_2002.11.05.tar.gz

# CEPC beam crossing

CEPC double Ring

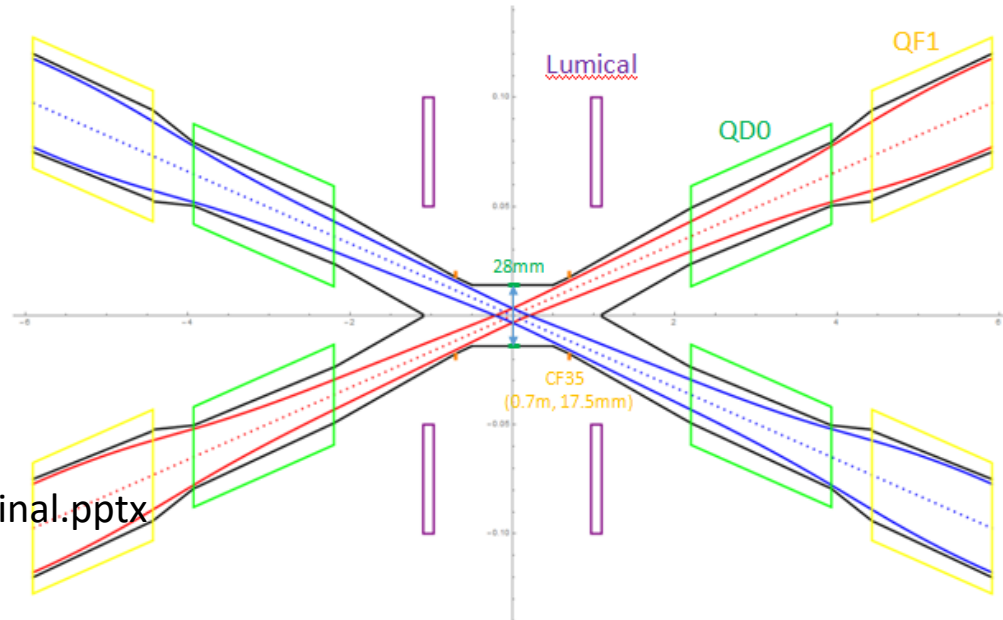

● Beam crossing 33 mRad

Focal length:  
 $L^* 1.5\text{m} \rightarrow 2.2\text{m}$

## Beam pipes

- Electron and positron beam stay clear (magnet, vacuum chamber) → important input into the beam pipe shape design, connection from single pipe to double pipe is realized by flange CF35.
- The central part is Be pipe with the length of 14cm and inner diameter of 28mm.

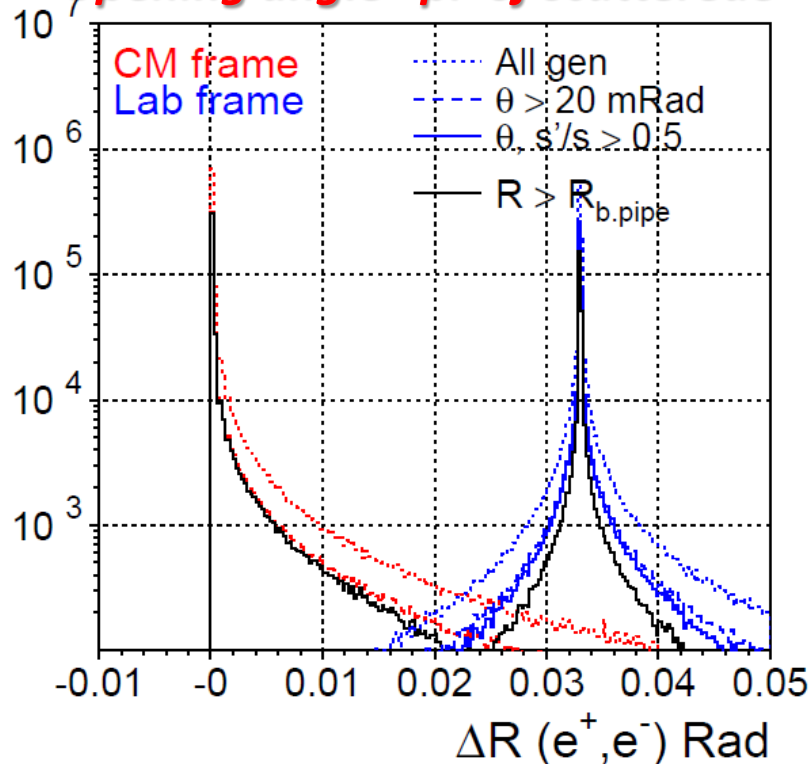

Wuhan 2017.04.19 workshop  
Introduction\_to\_CEPC\_MDI\_final.pptx

# Bhabha back-to-back boosted by CEPC beam crossing

- Bhlumi electrons boosted for the 33 beam crossing by  $\sim 16.5$  mRad to +x direction
- Compared for Bhabha selection conditions

**Opening angle  $-\pi$  of scattered  $e^+e^-$**

**Bhabha at detector plane  $Z=1m$**

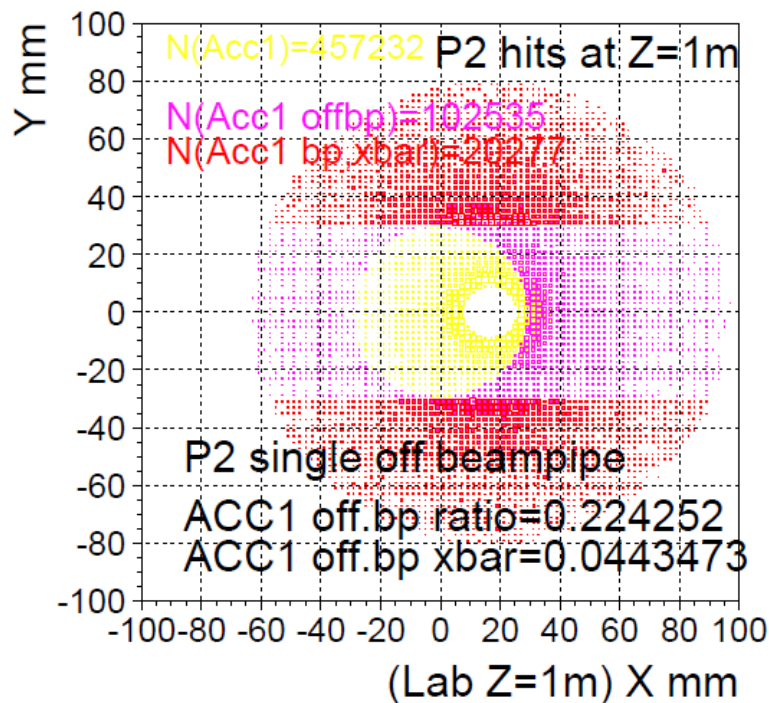

# Bhabha X sec. vs Lab z-axis round pipe

- CMS generated  $\theta_1=10$  mRad  $\rightarrow$  boosted  $+16.5$  mRad,  $+X$  are low angle Bhabha
- Assuming beam pipe is LAB z-axis centered, **radius = 30 mRad** ( $r=30$  mm @  $z=1$  m) at  $x=+30$  mm, Bhabha electrons are of  $\theta=13.5$  mRad

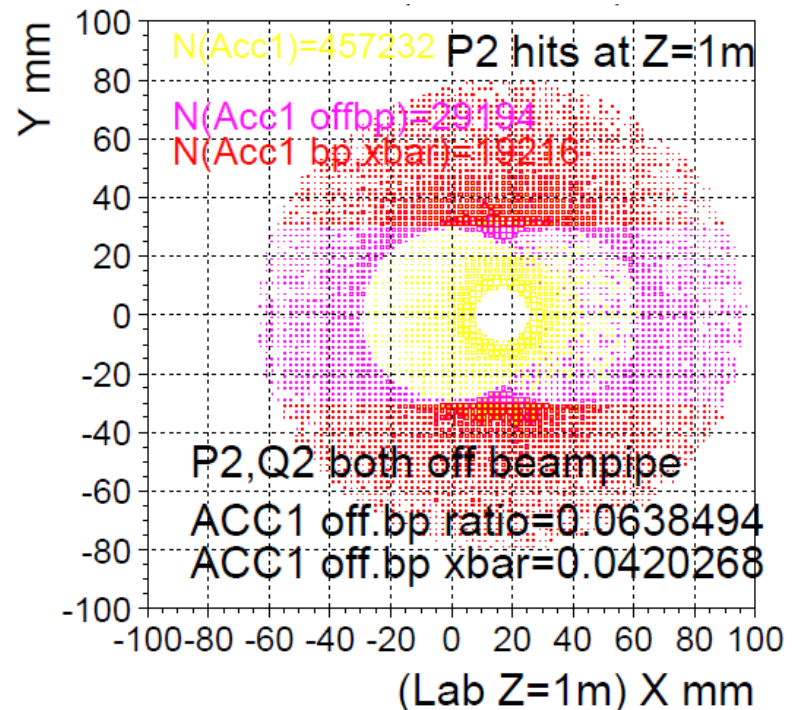

$\rightarrow$  Off beam pipe, detect: **one electron (262 nb) / both electrons (74.6 nb) = 3.51**

$\rightarrow$  Hori. cut  $\pm 30$  mm : **one electron (51.8 nb) / both electrons (49.1 nb) = 1.05**

Hits of ONE Bhabha electrons

Hits of electrons, both detected

# Bhabha X sec. vs Lab beampipe options

## Round beam pipe, 30 mRad

CMS 10 ~ 80 mRad		LAB ONE electron		LAB both electrons	
BARE1		off beampipe full phi coverage	off beampipe cut off $\pm 30\text{mm}$	off beampipe full phi coverage	off beampipe cut off $\pm 30\text{mm}$
Nevents	457232	102535	20277	29194	19216
Xsec (nb)	1168.3	<b>262.0</b>	<b>51.81</b>	<b>74.60</b>	<b>49.10</b>

**-2 mRad radius  $\rightarrow$  20% increase in X section**

## Round beam pipe, 28 mRad

CMS 10 ~ 80 mRad		LAB ONE electron		LAB both electrons	
BARE1		off beampipe full phi coverage	off beampipe cut off $\pm 30\text{mm}$	off beampipe full phi coverage	off beampipe cut off $\pm 30\text{mm}$
Nevents	457232	135842	24236	34847	23010

# Bhabha measurement

Beam crossing: 33 mRad

→ Boost off ring center (+x axis)

→ offset 16.5 mRad maximum  
(electrons on x-z plane)

*LOW angle Bhabha on x-axis  
one electron detected (+x side)  
the other electron (-x side)  
is boosted into beampipe  
NOT counted for Lumi measurement*

**Proposal:**

**Insert Crystal Scint. *LumiMon* on outgoing pipe  
to trigger/back-to-back for Bhabha <50mRad on x-axis  
with one electron lost into beam pipe**

*Very hot region,  
Low angle Bhabha  
boosted outward*

# Geant implementing new GEOM

1. Be 的長度為 140mm，Z 範圍-70~70mm。
2. 以 IP 單側為例，Be 管及銅管的尺寸見下表及附圖，真空管相對於 IP 對稱。

材料	Z 範圍 (mm)	內直徑 (mm)	備註
Be	0~70	28	直管
Copper	70~200	28	直管
	200~500	28~35	錐管
	500~700	35~39	錐管，包含波紋管

## Beam pipe drawing after CDR

Assuming a tube beam-pipe joint of Be, Cu

Electron Traversing 2mm Cu pipe → very "THICK" in forward direction

# Geant implementing new GEOM

X3TB

RUN	NR	1
EVENT	NR	2

## Material thickness

traversing 2mm thick Cu beam pipe

$$2\text{mm}/L = \sin ( 30\text{mRad}) \quad L = 33.34 \text{ mm}$$

$$\sim 2.3 X_0$$

$$2\text{mm}/L = \sin (100\text{mRad}) \quad L = 10.02 \text{ mm}$$

$$\sim 0.7 X_0$$

$$X_0(\text{Cu}) = 1.44 \text{ cm}$$

# New Beam pipe is LAB centered

Ji Quan

## 束流管内方案

顶点探测器位置

$\text{Arccos}(0.99)$  (30~100)mrad (20~80)mrad

亮度探测器位置

内钹管厚度: 0.50  
外皮管厚度: 0.35  
内外钹管间隙: 0.5  
冷却介质: 1号电火花油

说明:

1.  $\text{Ø}25$ 和 $\text{Ø}31$ 是根据白莎的计算, 最小束流管孔径
2. 亮度探测器对应管道为单层管(无冷却), 需根据计算确定184mm 是否满足温度要求

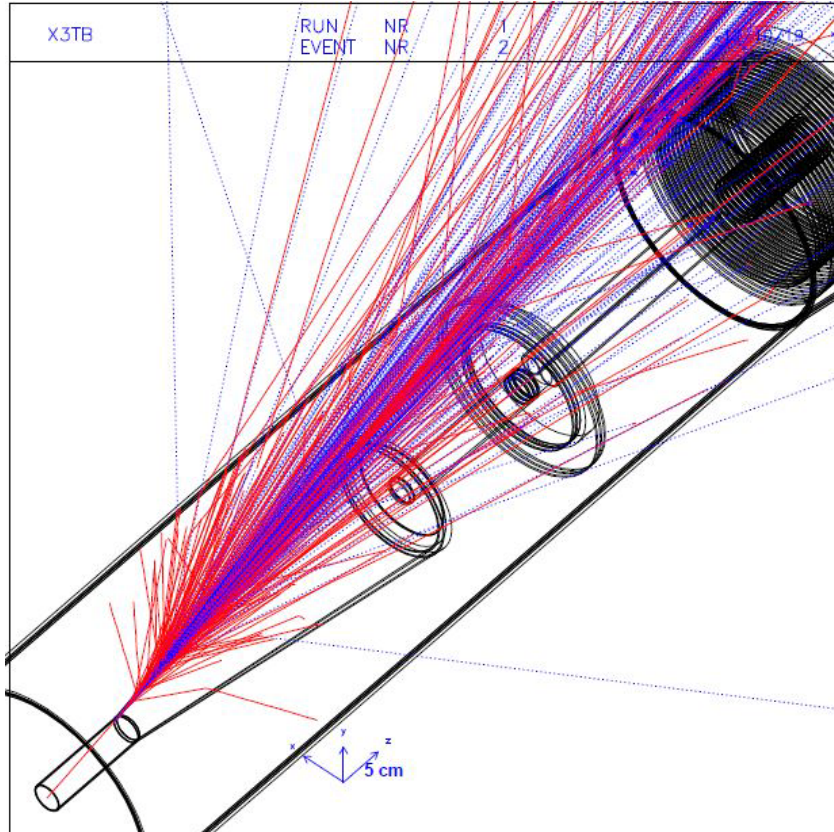

# 50 GeV electron shower on beam pipe

**GEANT simulation precision is 0.1 MeV**

**Beam pipe cone is at Theta= 130 mRad**

**Material is a Delta function at 130 mRad**

shoot at 130 mrad, hit the cone pipe

shoot at 134 mrad

# 50 GeV electron shower vs. angle

Angle = 785 mRad

Angle = 130 mRad

Angle = 110 mRad

Angle = 140 mRad

Angle = 127 mRad

Angle = 95 mRad

Angle = 135 mRad

Angle = 124 mRad

Angle = 80 mRad

Angle = 132 mRad

Angle = 118 mRad

# Shower leakage, electron <130 mRad

## Negligible to Tracking volume

- Material  $\sim 2X0$  (< $3X0$ ), energetic secondaries go forward toward Q-pole
- Large angle secondaries are very low energy (<100 MeV), mostly stopped by the 5 mm Fe TUBE

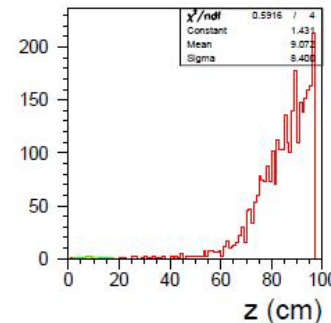

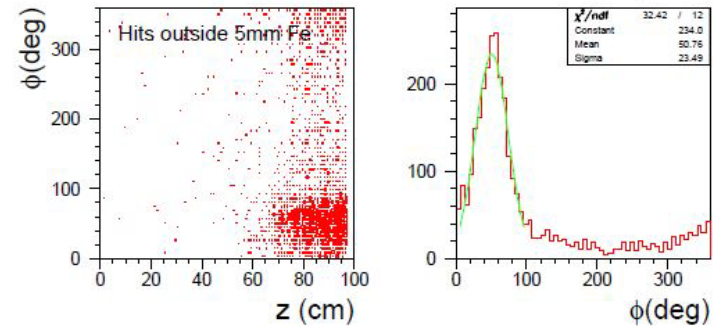

# Shower on $Z < 970$ 5mm Fe TUBE

Monitor particle hits before/after 5mm Fe support TUBE ( $r = 123.4$  mm)

50 GeV electrons at  $\theta = 95$  mRad **edge of LumiCal**

Shower by Flange and 2 layers of W (1X0)

Secondaries are behind  $Z > 700$ mm

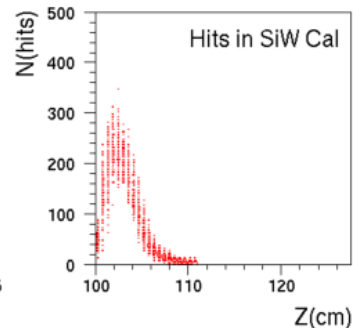

# Shower on $Z > 970$ 5mm Fe CONE

Particle hits before/after 5mm Fe CONE around LumiCal ( $r = 123.4$  mm @  $Z=970$ mm)

50 GeV electrons at  $\theta = 95$  mRad

Shower by Flange and 2 layers of W (1X0)

Secondaries are behind  $Z > 700$ mm, **continue on at LummiCal**

# 5 mm Fe blocking shower to Tracker

**GEANT particle momentum unit/precision is 0.1 MeV**

**5mm Fe surrounding beampipe, 2X0 Tungsteng in Flange, 20X0 in LumiCal**

- > 130 mRad → shower caused by 5mm Fe layer
- @130 mRad → max shower by beampipe, Q-pole edge
- ~100 mRad → LumiCal leakage

**→ < 100 mRad Tungsten, 2X0 in Flange has little leakage effect**

Electron theta Angle mRad	Hits/event <b>z&lt;970mm</b> <b>outside/inside TUBE</b>	Hits/event <b>z&gt;970mm</b> <b>outside/inside CONE</b>
785 mRad	28.3 / 12.0	.029 / .003
140 mRad	75.8 / 10.8	32.7 / 16.4
135 mRad	80.7 / 9.92	61.0 / 27.9
132 mRad	<b>539</b> / 1162	123 / 122
<b>130 mRad</b>	<b>444</b> / 1138	<b>129</b> / 227
127 mRad	6.40 / 27.5	<b>836</b> / 1605
124 mRad	1.88 / 4.84	9.46 / 28.4
118 mRad	.023 / .183	.036 / .153
110 mRad	.022 / .172	.031 / .139
95 mRad	31.2 / 88.8	<b>391</b> / 787
80 mRad	25.1 / 72.4	81.6 / 159

← Support Tube shower

← Beampipe shower

← Q-pole edge shower

← LumiCal edge shower

# Precision on electron impact position

Attach behind beam-pipe cone face, whatever material thickness,  
Impact position is not effected by multiple scattering/fragmentation

➔ **Better than 1  $\mu\text{m}$**

50 GeV electron, shoot LumCal center theta = 40 mRad

# Precision on electron impact position

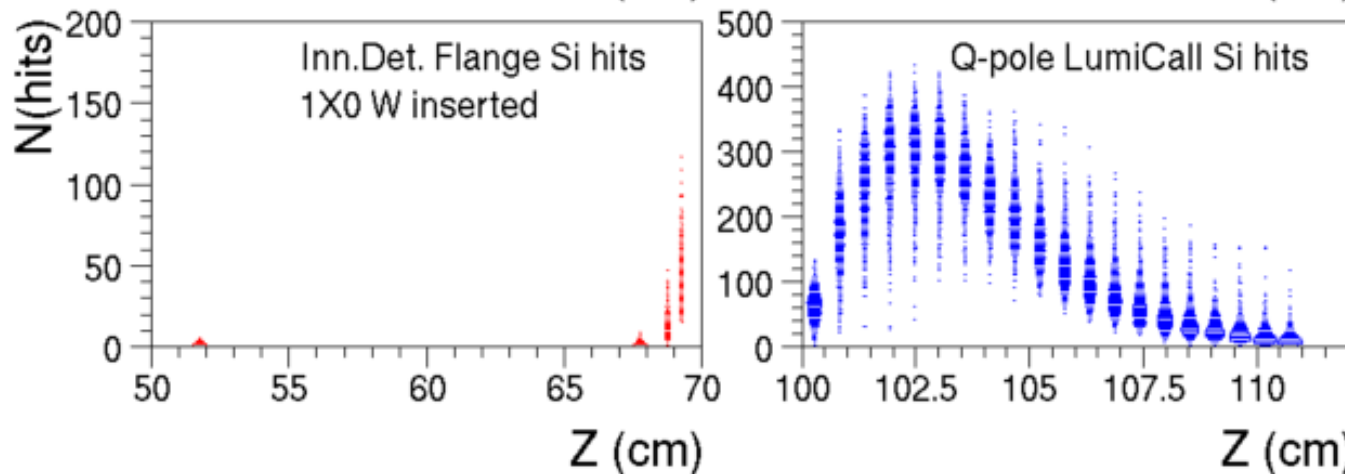

Compare Flange having 2X0 Tungsten layers OR NOT

GEANT particles of 0.1MeV

Hits of shower secondaries on Si layers

← Flange has  
NO Tungsten layers

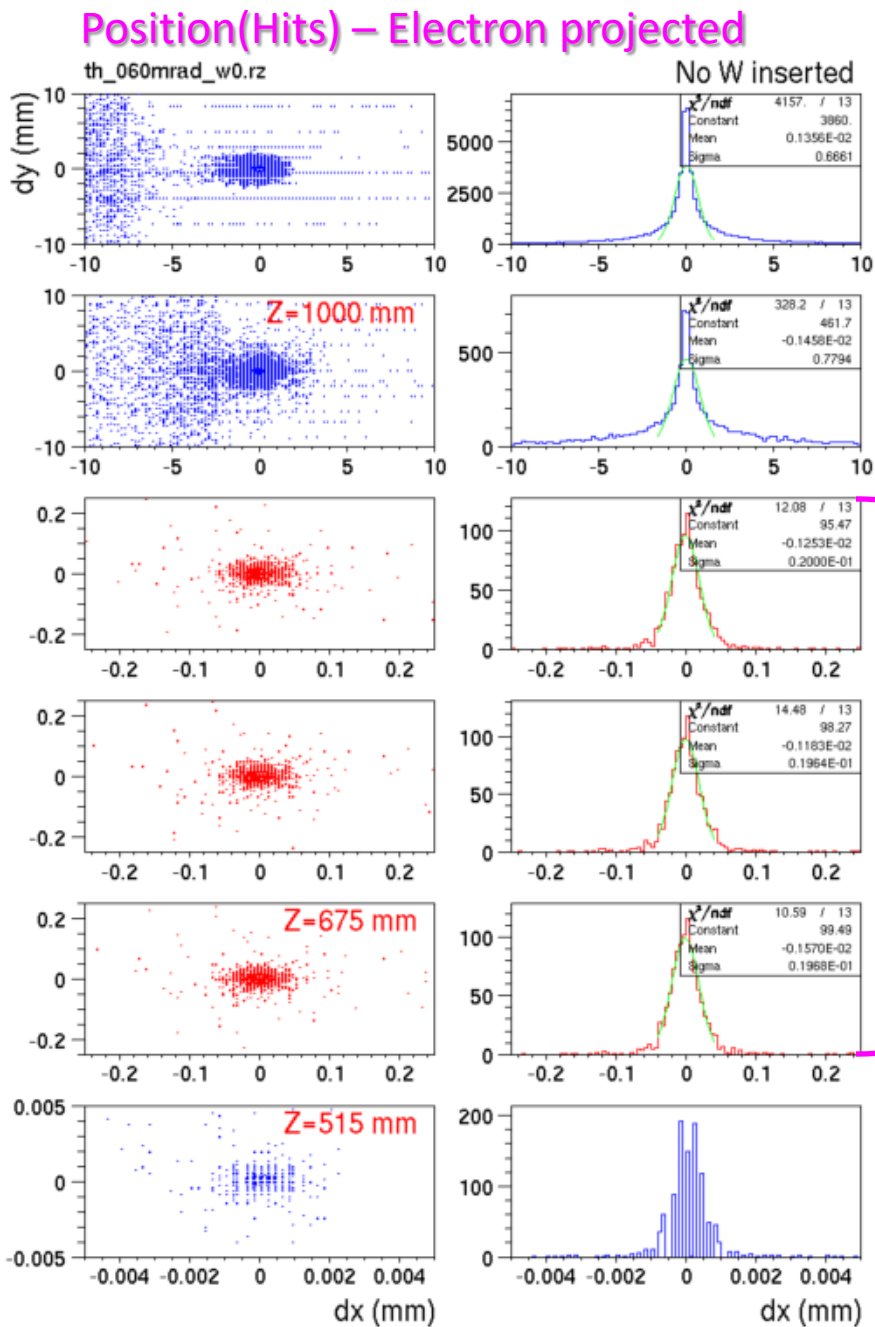

← Flange has 1X0  
2 Tungsten layers

# Spatial Resolution of piled up hits (50 GeV electrons)

Front 2 Si-layers of Q-pole LumiCal  
Pileup of shower  $\sim 1$  mm resolution

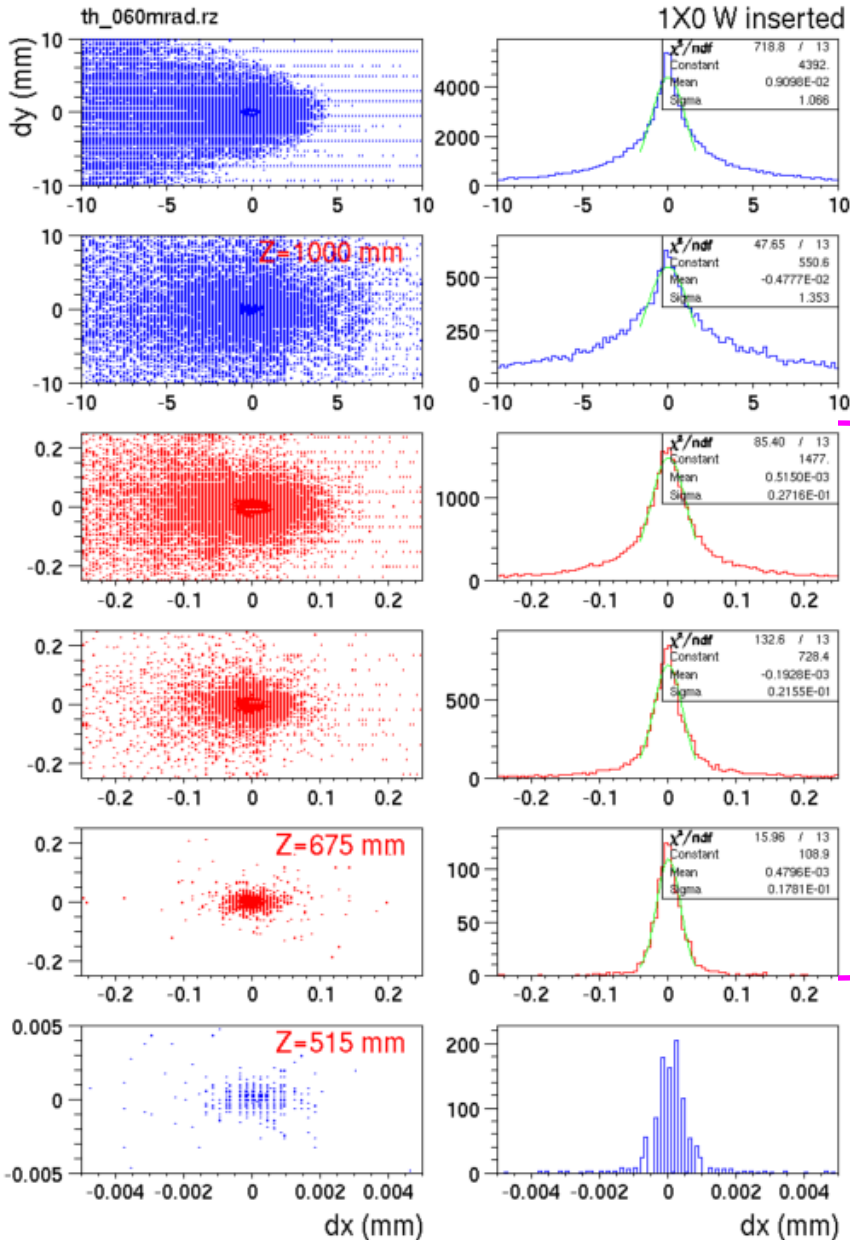

Three Si layers at  $Z > 670$  mm  
NO Tungsten layers  
Spatial resolution  $\sim 20 \mu\text{m}$

1<sup>st</sup> Si layer behind Beampipe cone at  $Z = 515$  mm  
Hit deviation better than  $1 \mu\text{m}$

# Spatial Resolution of piled up hits (50 GeV electrons)

Position(Hits) – Electron projected

Front 2 Si-layers of Q-pole LumiCal  
Pileup of shower  $\sim 1$  mm resolution

Three Si layers at Z>670 mm  
Two 1X0 Tungsten layers behind Si wafers  
Spatial resolution  $\sim 20$   $\mu$ m

1<sup>st</sup> Si layer behind Beampipe cone at Z=515 mm  
Hit deviation better than 1  $\mu$ m

# Detector segmentation for LumiCal

Implementing a Si-W LumiCal in CEPC detector simulation

## Geometry – hollow circle shape detector

Beam pipe code in macro file : /Mokka/init/EditGeometry/addSubDetector tube\_cepc\_v4

x 30 layer  
● ● ●

# Detector segmentation for LumiCal

Vary the pixel size in Theta, LumiCal at Z=500 mm

## Geometry of current LumiCal, (4 layers tracker + calorimeter)

LumiCal three hits acceptance :  $3.39^\circ - 11.09^\circ$   
 : 59 mRad – 193 mRad

Tracker :  
 Sector width : 20 - 75  $\mu\text{m}$   
 Sector  $\phi$  rotate :  $3.75^\circ$   
 Position 500 mm  
 LumiCal inner radius : 30 mm  
 outer radius : 100 mm

\* Sector width not to scale

Electron with flat distribution was used in this report

# Detector segmentation for LumiCal

Pixel size in Theta,  $75\mu\text{m}$  ( $=.15\text{mRad}$ ) LumiCal at  $Z=500$  mm  
LumiCal only, Electron hit position resolution  $\sim 2$  mRad

Angular difference at acceptance edge,  
 $75\mu\text{m}$ , case – 2.1 LumiCal

# *Detector options*

## **Electron impact position to 1 $\mu\text{m}$ precision**

- fine pitch Si-wafer stick to beampipe
- covering theta range  $\sim 30$  to  $100$  mRad

## **Electron/Photon ID**

- Multiple Si-wafers to ID photon tracks  
being originated from IP or beampipe fragmentation

## **Beam electron ID**

- LumiCal segmentation for 1 mm resolution
- Could be Crystal + SiPM

## **Combined detection of Bhabha,**

- Detect Bhabha single-electron Bhabha at low +X region
- Build far-forward tagger on  $-X$  electron (behind Q-pole)  
to trigger Back-to-Back Bhabha
